I have had fantastic success de-stenching kit simply by locking it in a small room with a good ozonator on full output for a week.

Even the microphone, when hung a few inches in front of the output breeze directly in the stream, is rendered completely odorless.

Good luck!

I have 2.1 and I'm still learning. I didn't do a level check
- I was only wanting to compare 2 antennas, not establish
an actuall DBv reference.

Only two punctuation marks in the whole body and they were both in error.

And, observe the "electronic's" in the Subject:.

You might want to be careful subjecting your electronic gear to ozone as
it is a very corrosive gas and can deteriorate rubber, plastic and
electronic components.

No. Electronics is the pural of electronic.

Electronic's is a possessive meaning that whatever follows belongs to
electronic.

Ozone is a strong oxidizer. Rubber and plastic don't corrode, but
they do oxidize.

Regular scented dishwashing detergent bath is safest for plastic pieces and makes a good bath for everything.
Citrus cleaners will work faster but may be too harsh. I use a variety of acid brushes cut down and soft tooth brushes and paint brushes. I learned all about it with inside telephone systems. I have had to throw away some mics after immersion.

VFO230 will have fragile plastic, encoder and markings, so very weak solutions there. Housing should be dipped in a stronger solution and brushed. Boards will be a problem as anything you do will wash debris under the chips causing shorts between pins. If you do dip the boards, it is risky but use clean de-ionized water in the final rinse.

Greetings,

I have a Kenwood TR-9130 2 meter all mode that behaves in the following manner:

The display is blank.

Turning the squelch knob will make the green receive light come on and static come out of the speaker.

On transmit the red light will come on (the speaker will silence if there is sound), but the meter does not move and there is no power out.

I am assuming the radio has lost lock, does anyone have any suggestions on this radio?

Thanks and 73,
Joe

I saw an article in an audio magazine some years ago, by a guy who was
servicing a stereo receiver which had this problem.

His advice was to open it up, and leave it outdoors in bright summer
sunshine for several days to several weeks. The heat helps drive out
the smelly volatile compounds from the tobacco-smoke tars, and the
ultraviolet light breaks down the tars.

Depending on the equipment's construction and what it can tolerate in
terms of solvents, you may also want to try a washdown with a
plastic-safe circuit-board cleaner - one designed to remove flux
residues and organic contaminanants without damaging components.

Switches, potentiometers, and other sliding contacts will probably
need to be cleaned to remove the tobacco tars... a properly-
formulated contact cleaner spray, or a liquid applied on chamois swabs
or other cleaning pads, should be used for this.

Unfortunately, tobacco-smoke tar is tough and tenacious. Consumer
Reports apparently uses it as their "hard to remove" contaminant when
testing glass-cleaning products.

Source record: 15939

I am interested to sale my hf antenna above mentioned that is in very good conditions.

Reason: need to renew and create a new set up of antennas.

Antenna: Sommer (DJ2UT Beam)
Model: XP 707
Bands: 10, 12, 15, 17, 20, 30 and 40 meters
Balun: The balun furnished with the Sommer antennas is a low-loss air core type using RG142 (BU) Teflon cable. The balun will handle 2.9 kW continuous output at 30 MHz with a loss of only 0.05 dB.
This antenna it still on my tower and working very well.
For price please send one email to:
fartolopes@mail.telepac.pt

The transports costs will be at the resposability of the buyer.
If you are interestes we can sed some actual pictures, and for all the informations concerning gain and front/back, please go to the oficial site:
http://www.sommerantennas.com/beaminfo.html

Source record: 15943

I acquired a TM733a which seems to work fine however the display remains dim no matter what setting is used to chjange it - is it most likely something as simple as a burned out display bulb, or possibly something related to the CPU? The control for brightness is able to turn the display OFF but cycling though the different values D1, D2, etc make no noticeable change in the brightness. Thanks.

> Comet, etc.?? Need to determine the range and voltage.
==========

This being a homebrew =home'do' newsgroup ,may I suggest you check the capacitance range with (for example) a MFJ 259B analyser (bought or borrowed). This enables you to check capacitance range at RF frequencies up to 170 MHz.

Max operating voltage can be checked with a 'HiPot' tester which can be homebrewed or perhaps borrowed (local radio club member) If you have other High Voltage components to be tested , it is very much worthwhile to homebrew a Hipot tester.
Have a look at Rich Measures AG6K's website .
I am the happy owner of a Danish made 30kV non-destructive insulation tester ,bought from a surplus store for equiv. $ 30.-
This instrument determines the breakdown voltage (in 3 ranges : 0 - 3 , 30 and 30 kV) of components at a current down to 1 microampere.

Source record: 15854

Sorry for the cross posts. I'm trying to locate someone.

I'm looking for a ham living in Calgary who was going to align my
Heathkit SB-401/SB-303 combo last year (or was it two years ago?). I
lost the email address and phone number --- everything. He mentioned he
could also align my Cardon "Spitfire" as well (if that rings a bell).
I'd like to ship the pair off for alignment now that it's warm weather.

Also, if there is anyone else who can do this, please contact me in case
I can't find the above person.

Thanks very much.

>keypad has issues? thanks Mike

There's a trick to it.

First, press [F] + [VFO] + POWER ON. This assigns the "Enter" function to
the PF button on the microphone.

Then, to enter a frequency directly:

Press BAND SEL to select the desired band.
Press VFO.
Press microphone PF.

You can then enter the digits whose places are indicated by "-" on the
display. Press any mic button other than a digit or PF to cancel
direct entry and return to VFO mode.

I'd strongly suggest that you go to www.mods.dk, click Kenwood and
then Manuals, and download the TM733a manual. It looks as if this
radio's human interface is very non-intuitive!

Also a junked GR-64 Heathkit Shortwave receiver is close, but the filament output is 12.6 V. I used one to make a 90VDC/2VDC battery eliminator for an old 1936 farm radio - works great.
I imagine alot of the Heathkit signal generators, signal tracers, etc.. would have similar transformers - you could check specs of online manuals then zero in on your exact needs.

Source record: 15878

FS: Clegg model FM-27B 2-meter amateur transceiver. It is a 146.0 to 147.99 MHz, narrow-band (5 KHz), 25 watt mobile transceiver. The radio utilizes a 'crystalplexer' frequency synthesizer system to generate the transmit and receive channels. The receiver works fine, but have not checked out the transmitter. Don't have a manual and frankly can't figure out how to get the cabinet off. The cabinet is in good condition, having only a few very scratches. The front panel has some tarnish and scratches. Include is the original microphone, power cord, locking mounting bracket (no key). Price is $40 shipping in lower 48. Thanks, Charlie Hugg, K5MBX

2006. Strange local broadcast radio transmitter problem

Date: 2005-04-23 17:23:00 UTC
From: Ben Peddell <klightspeed@klightspeed.is-a-geek.net>
Message-ID: <d4e09kghi1@xuxa.iecc.com>
Source record: 15879
Cross-posted to:
alt.radio.broadcasting,alt.radio.scanner,aus.radio.broadcast,aus.radio.scanner,rec.radio.amateur.equipment,rec.radio.broadcasting

I don't know which newsgroup would be the best place to ask this.

A local FM radio station is transmitting on multiple frequencies above and
below its normal frequency.
Its normal frequency is 93.5MHz, and it's also transmitting on 500kHz
steps between 91.5MHz and 95.5MHz, with the outer bands a few decibels
above the noise floor.
I hooked a multimeter up to the input of the 5-stroke signal meter on my
radio, and here's the values I got:
91.5MHz: 130mV
92.0MHz: 235mV
92.5MHz: 290mV
92.7MHz: local station: 250mV
93.0MHz: 330mV
93.5MHz: 290mV
94.0MHz: 330mV
94.5MHz: 255mV
95.1MHz: local station: 300mV
95.5MHz: 50mV
noise floor: up to 20mV

The most realistic waveform I can get with that data is very strong
(>1000mV) pulses about 500ns wide, with weak (~100mV) reversed regions
between.
I don't have an oscilloscope to verify this, though.
Have any of you experienced this kind of problem with your
equipment, and what was it caused by?

2007. Heil Clear Speech Speaker

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-23 21:58:53 UTC

Cross-posted to: alt.ham-radio.dxing,alt.ham-radio.eme,alt.ham-radio.ssb,alt.ham-radio.vhf-uhf,rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment

The Heil Clear Speech Speaker arrived today and I got busy installing it. I gave it a quick operational check then took it apart and photographed it inside and out. I also scanned the Owner's Manual and created a pdf file from it. I did have to add an Amidon core to the power lead and the signal input lead since with 1KW I had RFI feedback. The cores resolved it 100%.

I am so very pleased and yes after the 746 Pro dopes all it can to reduce noise the Heil Clear Speech Speaker can and does further reduce the audio noise dramatically. I purposely tuned several weak and noisy stations on HF and VHF and the dsp speaker did make an unworkable signal literally arm chair copy..no kidding. Years ago I had the AmCom Clear Speech Base box on my TS450 and it gave similar results. These things really do work.

See photos and download manual here....

Charlie,

I have a Am-Comm Clear Speech and find it indispensable for mobile work. Do you see a significant difference between the Heil and Am-Comm?

Tnx and 73,

Don't think it's that simple. Multiple impedances map into the same
swr. But the limits of the tuner are based on impedances. That's why a
tuner might match high SWR for some cable lengths but not others.

SWR is just a scalar number that's easy to measure and very useful when
you're just trying to get to 1:1 where it maps directly into properly
terminated cable.

Yes....the Heil has better sound and has adjustable levels of dsp although I typically leave mine on the highest level. I like the headphone jack and tone control neither of which my CS Base had.

Interesting. Some of this could be subcarriers for stuff like Talking
Books; I know there is at least one station in the OKC.ok.us area
that transmits a subcarrier for broadcasts to the blind and visually
handicapped, since my late wife used to have a receiver for it. Possibly
other subcarriers are Muzak or similar broadcast "background music"
services.

Can you get someone to look at that that with a spectrum analyzer? Can you
get hold of an NBFM receiver?

If it's really something wrong with _them_, then I'm sure their engineer
would be very glad to know before the FCC sends a pink slip. And if they're
transmitting special-purpose subcarriers, the engineer will be able to tell
you about it.

Are you certain they are putting out multiple signals -- or -- is their
signal simply overloading your equipment and generating spurious responses
that look like multiple signals? Remember, a commercial FM broadcast
station is putting out a zillion or so watts ERP -- that can cause a lot of
overload for a short distance around the antenna.

might just be that the radio is being overloaded by the local radio
station and this is showing up as images

have you tried this test on another radio reciever?

I've heard this, caused by a transmitter fault. (the station, on 92.9,
was transmitting every 400KHz - which really raised havoc with the local
stations on 92.1 and 93.7!) It was like that for a few hours on a
Saturday, then promptly cleared up.

What is a five stroke signal meter? Red bars on a consumer stereo?

You use a field intensity meter or a spectrum analyzer to measure
signal strength. An oscilloscope isn't really very useful.

All kidding aside... a digital speech processing app is an excellent idea. However, you can get them for free (download off the internet!) Then, by using either the line in (preferred) or mic input on the sound card of your computer, and your computer speakers or sound card output--you can process that audio to unfathomable depths!

Regards,
John

They got N8WWM already.

If you see the fugly felon doug at Dayton ask him these questions.

(he will be attempting to sell some trash there if I didn't
scare him away again)

1. How is the court ordered shrink working out for you?

2. How's the court ordered job hunt going?

3. How's the court ordered wage withholding going?

4. Have you made the rain report for jamming repeaters again, Doug?

5. Have you threatened to kick anyone elses ass, only to have them show
up at your section 8 slum and prove what a fucking coward you are, maggot?

Here's what the felon looks like:

http://img258.echo.cx/img258/8190/fuglydogiecloseupgif7bt.jpg

and

Rob, got a 2040 also, mine has 28 uh roller inductor
in the middle and it hanldes extreme loads! Dont know
what your trying to tune, but have 2 loops here and its a
breeze to work with! sometimes a single wire antenna
poses a threat to the tuner. got a analyzer here and it
seems to tell the truth more often than not!
Key is a good ground, and is a must!

steve.... gud luck.

Hi Steve,

Thanks for the information.
Good ground where, though? Around the antenna, like 'wires in the lawn.'
Or, a good ground from your transmitter to ground, or good ground
from your SA-2040 to ground (or both via separate braids to a common
ground point --- like a cold water pipe. Not too sure. Can you elaborate?

How did you create your good ground? How about if I soldered a 5 ft.,
3/4 inch braid to the point where the cold water feed from the city
enters the basement --- I can set up the whole station right in that
location then (within that 5 feet I mean, because the basement is
unfinished. How are you doing your grounding?

Thanks for the help.
--- Rob

Question -- got a buzz at this QTH; sounds like powerline hash; the
ordinary analogue noise-blankers on my Icom 735 and JRC NRD-525 will
take out the noise, but introduce heavy distortion on the received
signal. Will the the ClearSpeech digital doobies take out the noise
without distorting the signal?

How close to the transmitter are you? I remember living across the road
from a Tourist FM88 station and it had a dirty transmitter, but because
my equipment didn't cost thousands (for filtering etc) and wasn't new
they said they couldn't do anything (more like wouldn't). I could pick
it up on my old receiver in various places from 4mhz-800mhz.

>I've heard this, caused by a transmitter fault.

We have this sometimes with police radio transmitters. It is one
single make of transmitter which shows this problem now and then -
exchanging the PA cures it. With those radios the signal shows up
every 80 KHz.

Being that far off the normal frequency is not subcarriers. The bandwidth
is 200 KHz. Of this about 150 KHZ is used for the normal FM data. Of what
is left over sometimes this is used for the talking books, background music
for stores, pagers, and other things.
If you are recieving the station at 500 khz or more away then you have
defective equipment or the station is transmitting way out of what it is
suspose to be.

Your receiver is probably being overloaded by the strong signal.

Do somthing, or anything, to attenuate the signal received from the
antenna.

You'd think that such a thing would have a bandwidth of less than 400kHz.
This thing has a bandwidth of close to 4MHz, with _exactly_ the same FM
signal on _every_ harmonic between +2MHz and -2MHz.

On Sun, 24 Apr 2005 04:18:02 +0000, David wrote:

True.

BTW, we're in Australia, so it'd be the ABA (Australian Broadcasting
Authority) in place of the FCC.
I'll have to bring it to the attention of the manager of Reef Rhema (one

of my friends) when I see her tonight.
I've been trying to bring it to the attention of Vision FM, but seem to
have failed.

FS: Ryan Communications 30 meter CW-QRP transmitter. Milliwatts to five watts with 9 volts to 14 volts. Comes with an extra final & a crystal for 10.106 MHz, the 30m QRP stand-by frequency. FULLY assembled and two different size crystal sockets are on the tx board. I use my three other Ryan transmitters with my Sony 7600 receiver and it makes for a great little portable ham station. ONLY $29.95 w/ crystal, instructions and extra final amp transistor!!! (Plus $5.95 First Class USPS mail & insurance.) wa8mea@hotmail.com.

You may or may not need an RF ground, depending on whether you are
tuning a balanced or unbalanced antenna. I have 1/2" braid coming off
the back of my mfj tuner to a short length of copper pipe (I have rock
about 12" down), and then I have two 70-ft buried wires across the
lawn.

I'm still trying to decipher what constitutes a good or better tuner.
I recently got an older Murch 2000 transmatch whose components, the
two variable caps and the variable inductor, are about 50% bigger than
those in my mfj-989c, but the Mighty Fine Junk tunes bands the Murch
won't touch :-)

Oh, well...

Charlie,

Thanks for the review....I have one of the older versions...an AmCom speaker/ DSP combo...and wanted to give my "unbiased" input.

The speaker does take out some noise but, unfortunatley I cannot give it the same "unworkable to arm chair copy" review you have. I've used this with my MP, MP Mark V and currently with my mobile FT100D. All experiences have been the same; mediocre. There were few instances where the AmCom alone made a signifcant difference.

The voice quality is very degraded when the DSP is engaged and the audio level drops substantially and has a "talk in a barrel" quality. Having one of the earlier models, I found the heavily engaged, non-variable DSP to be quite annoying. Also, I found that the unit is definitely NOT required if you use the internal DSP of the rig. Yaesu DSP and noise reduction are more effective than the AmCom.

This is the second unit I've tried, having thought the first to be defective. AmCom was nice enough to replace the first.

Additionally, I see you found out that the unit is RFI prone. Remarkable that this should be the case for such as expensive accessory that is supposed to be functional in an RF environment.

In short, Good Luck with the unit....and thanks for the review....

I'm looking around at starter equipment that is simple(!) for my ability level.

I like the idea of built-in ATUs for making my installation easier too. What do you suggest?

Also, what type of antenna should I be looking at?

Do I gather that I should be looking at HF equipment?

Many thanks... Greg

Hi Charlie,

Picky? No, I don't think so. I want a rig that works
right, hasn't been abused, doesn't reek of cigarette
smoke, and comes with what it's supposed to come with.
I don't think I'm being picky. I don't buy junk. I
buy nice gear. If I could get a nice one for $500, I
would jump on it! However, the going price seems to
be $750 to $1100, depending on the accessories and
options that are included. I fully expect to have to
spend that kind of money.

Not that it's any of your business, of course.

73,
Dean K5DH

Source record: 15842

Hi Greg,

The answer to your question on "what equipment is ideal" greatly depends on your personal location and circumstances.

Some general thoughts:

If you're just starting out, get a less-expensive rig. You don't need to start out with something like an FT-1000. Are you interested in operating voice (FM/SSB, or even AM?), CW, or digital? Some rigs handle some modes better than others. Do your research.

> I like the idea of built-in ATUs for making my installation easier
> too. What do you suggest?

Automatic tuners can make life a lot easier. You don't need a rig with one built-in--there are good external ones that inexpensive. I've heard good stuff about the LDG Z-100. I have the LDG QRP autotuner, and it's great. I also have a manual MFJ 969, which is nice. Nothing fancy, but it works.

> Also, what type of antenna should I be looking at?

Depends on where you are and what your restrictions are. I'd contact a local Ham club and consult with the members about what would be appropriate.

> Do I gather that I should be looking at HF equipment?

Assuming you have a license permitting you to operate on the HF bands, yes.

73,

-Josh, AE6IQ

I have a similar problem with my TM-732. I need the display itself.
The only thing I can think of is to advertise for one that has fried
the finals or something else that the owner doesn't want to fool with,
and just buy it for parts.

Source record: 15751

Last night I heard a strange effect on a 6m beacon some
81 miles away. It sounded like a bad antenna connection
or AGC pumping. I tried everything from bypassing SWR
meters and coax switches, turning off my AGC, using
differant antennas, no help.

I asked a nearby station if he heard the QSB - nope!

Today, without changing anything, the QSB is gone.

If you have a mp3 player (who doesn't?) and want to d/l
a 939 kb file, you can hear a recording of the "mystery"
QSB effect I was hearing last night. It's at:

http://members.cox.net/kg0wx/

Thanks for everybody's help!

Ken,

Perhaps your radio may be getting de-sensed? Depending on how close the source is, your radio may hear it, but not your friend's. Maybe the kid next door is using a 49 MHz RC car?

73,

AWARD: "POPE JEAN PAUL II - DXSPEDITIONER OF PEACE"

RULES

The section ARI of Sala Consilina (SA), ITALY, desiring to honor and to remember Karol Wojtyla , Pope Jean Paul II has founded the award "JEAN PAUL II - DXSPEDITIONER OF PEACE".

General requirements: Awards are available to all amateurs and SWLs for worked or heard at least 40 countries for BASE award of the 131 countries visited by Jean Paul II during his pontificate; 80 countries worked or heard for SILVER award and 131 countries worked or heard for GOLD award.

All the bands assigned to the Radio Amateur Service and all the modes are allowed, satellites included.

There are 4 versions of the award:
1) MIXED
2) PHONE
3) CW
4) DIGITAL MODES

To claim the Award the QSL cards are not required but they must be in possession of the applicant and could be requested anytime for checks.

To receive the forms for the award application and the list of the 131 countries visited by Pope Jean Paul II you can write to the award manager IZ8AJQ Erminio iz8ajq@amsat.org to receive them on your email address.

The fee is 10 Euro or 12 Dollars. To receive the Award as registered mail please add 3 Euro or 4 Dollars.

Application forms must be sent to this address:

ARI SEZIONE SALA CONSILINA
CASELLA POSTALE N.11
CAP 84036 SALA CONSILINA (SA)
ITALY

2087. VX-5R With Accessories

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-27 18:42:15 UTC
From: N5IFH <n5ifh@twcny.rr.com>
Message-ID: <b2Rbe.8453$XF3.2462@twister.nyroc.rr.com>
Source record: 15760

Greetings...I have a VX-5R and a bunch of accessories I would like to offer for sale. This is a package offer only!

VX-5R - Black - S/N: 9E061222
CD-15 Rapid Charger
Two FNB-58LI 1100mAh Battery Packs
MH-34 Speaker/Microphone
FBA-23 AA Battery Holder
Diamond SRH519 Antenna

Asking $300.00. US Postal Money Order only. Thanks....

2088. Nice Collins ART-13B on ebay right now...

2091. Balanced-Twin Line as Tuned Circuit

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-27 22:03:43 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <d4p27uqcf1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 15764

New Program "TWINTUNE.exe"

Using a tuning capacitor across one end of a balanced-twin line with a
short circuit at the other, the combination of line and capacitor
behaves as a high-Q parallel-tuned circuit.

Applications include push-pull VHF power amplifiers and power
oscillators.

The program also assists with design of ordinary HF balanced-twin
open-wire transmission lines. Zo and attenuation is computed.

Download program TWINTUNE from website below in a few seconds and run
immediately.

Yep! I sent similar postings to various lists and the file
has been picked over rather intensely. It has been noted
that the noise floor was constant and the rise/fall time
of the signal was instantanious.

Looks like it was lightning enhancement. Good 'ol

Very big thunderheads will spill electrons into the ionosphere,
(via "sprites") and thus might also cause some Es like openings.

Six is fun, you get just about any possible kind of propagation.

Message-ID: <d4r13c$2j5j$1@madmax.keyway.net>
Source record: 15770

It most often depends on the electrical equivalent of the
antenna system. Sometimes only minor changes in the
antenna system allow a tuner to do it's job. Your best bet
is to configure the antenna with a higher radiation resistance
than 50 ohms instead of lower. Try different grounds,
different antenna lengths, different tuners.

Often a different tuner configuration will allow a match.
To expect a single tuner to handle infinite matching situations
is ludicrous. Read up on the subject. The ARRL antenna
manuals are rich in theory. Consider that there may be many
undefined matching situations where infinite current or voltage
may be placed in the tuner that would burn or arc.

I have a 300w MFJ tuner (T net) that I bought used for $40 and
an LDG kit tuner (Reversible L net). They work just fine when I
design the antenna so that impossible matches are avoided.
Although the LDG may tune a greater range, that also causes
it to find a greater number of impossible matches.

Hi Greg,

speak with the folks at the local club. Nothing better than a local to help you. If they cannot answer your questions, take to the internet. Many sites with info such as the RSGB site at http://www.rsgb.org.uk

If I am well informed you will be able to use HF but I suggest you look into something which will also cover 50 & 144Mhz such as the Yaesu FT847 (or similar - cheaper) radio's. In your area VHF is also being used and will give you a completely different perspective. For VHF you need (preferably) a horizontal beam.

Again - it will depend on what YOU want to do. This hobby has something for everyone....

73 and GL on the test!

Hello,

I have just bought a TRIO 9130. It works well. But other OMs say that my audio is "metalic" or narrow ...

Is it a know characteristic of the TRIO ? Does anybody have information about it ?

I have not found anything on it on any product reviews on Internet.

Thanks for your help

Best regards

have a kenwood vfo 230 that quit when it got unplug from the radio
when the radio was still turned on the LEDS wont light up now or the

vfo their is no vfo output eather the fuse is ok and voltage is
preasent at the diodes inside i have been in repair for 50 yrs so
have a idea about electronics just havent work on any of this kind of

equiptment any ideas sure would be helpfull and would be greatly
apreacated thanks del k9fcm

2105. GMRS radios with PLMRS (or other) license?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-04-29 23:09:24 UTC
From: Mitch Berkson <mitch_news@bermita.com>
Message-ID: <F8zce.3$2J6.0@lakeread06>
Source record: 15778

I'd like to use GMRS radios to run a rowing regatta (in the U.S.). These require an FCC license but the GMRS license (http://wireless.fcc.gov/services/personal/generalmobile/) is limited to an individual and members of his household and relatives.

The Private Land Mobile Radio Service license (http://wireless.fcc.gov/services/plmrs/) looks like it might be what I need, but I'm not sure about that. Also the fee for a PLMRS license for a non-profit is $55 per call sign. Can I use GMRS radios with a PLMRS license? Does each GMRS radio count as a separate call sign? Maybe this suggests that PLMRS is not the appropriate license?

Thanks for any help.

Mitch

Hi, I have the Kenwood 9130 (trio).
What mic are you using with it??
If your using a crystal mic like a D-104 it
not sound so hot, too sharp and crisp / tinny.
Try using a stock type hand mic and see what the difference is.
I bet that is the problem.

But CB is likely to find more people - especially more local people - in many areas. CB is much more likely to find the guy in the pickup two cars ahead of you who just filled up after most gas stations in your county lost power in a major storm and with it the ability to pump gas - and thus tell you which are the few area stations that you can fill up at.
My area (Burlington, North Carolina) is fortunate to have a lot of downsized AT&T hams - so finding someone local on 2 meters is easy. But MANY areas aren't that way.

No $4 to park! No $6 admission!

Have you considered a less complicated and cheaper solution? Approach a
local ham club, they might be very happy to handle the comms for your event.
In South Africa (where I am) such communication services comprise large part
of many club's activities. In fact 50 hours of such "community service" is
one of the ways (now that the Morse test is no longer the only one) that a
holder of a restricted licence can upgrade to a full licence.

Mitch:
What Roger said.

In my area (greater Boston/eastern Massachusetts in the USA) these
events, which hams call "public service events" are routinely covered
for all of their communications by hams.

Recently, I was one of about 300 hams who staffed the Boston Marathon
as part of the 7,000 volunteers who work the event. Tomorrow, I will
be out at 6:15 AM to start working the annual Walk for Hunger (along
with about 75 other hams). Every fall, I also work the Head of the
Charles Regatta (which anyone familiar with rowing will know about) in
a similar role, with about 60 other hams.

Hams bring not only radio gear capable of doing the job well, but also bring communications and event management experience, and a variety of other skills.

In return, the hams, who are 100% volunteers, often receive an event T-shirt or hat, and occasionally a lunch. We use this as an opportunity for good PR and education about ham radio, and real-world practice for emergency communications.

If you contact the ARRL (American Radio Relay League) www.arrl.org for your area, you may well find that there is a similar group of hams in your area just waiting for you to ask.

Happy trails,
Gary (net.yogi.bear)

Chuck,

I searched for IC-720A and found the manual. The pre-driver is 2CS1971.
Drivers are 2SC1945. The finals are 2SC2907.
There all common Japanese RF transistors. RFParts , www.rfparts.com , lists
a matched pair of 2SC2097 for 67.90.
You should verify blown finals are the culprit before replacing. Good luck.

73,

Mike N2MS

While I agree with others that it would be an excellent idea to get the local amateur radio organization to provide (free) communications for your regatta, I wonder why you hadn't also considered the FRS radio system? No license, cheap equipment, and should be able to provide your communications requirements for a regatta, assuming you don't have hills or other obstructions to talk past.

I have considered FRS, but testing suggests that its range is insufficient.
We will need to communicate over a range of up to 2-3 miles. Even though
the conditions are very good, I don't think FRS can do it, but I would be
delighted to be wrong.

The range of 1/2 watt FRS radios, advertised as "up to 2 miles", is
more like 1/2 to 1 mile in real world conditions, and terrain and
architecture can reduce that further.

A typical 2 meter ham HT puts out 5 watts, has a better antenna, and
has access to repeaters. Much greater range.

There are only 14 FRS channels, and anyone can jump in with their own.
The PL tones do not help that much if there are other users on the
same channel.

If your event ends up buying radios, it can add up rather quickly.

We see many events try other means of communications, and they end up
coming back to asking hams to help out.

This is an interesting idea, but I'm not sure it will work in my situation. Three of the radios need to be in small referee's launches which already contain the ref and a launch driver. Another one will be at the finish line and a fifth will be on the dock.

I will look into this further though. Thank you.

Is this event held over line-of-sight water? If so, the FRS radios should work, though close to maximum range there. If there is terrain or just trees in the way, then 2 - 3 miles won't work. Be easy enough to probably get a pair to check the path over your maximum range, though.

As others have said, you'll get a much higher quality communications system if the local hams do it.

There is a slight outcropping between the start and finish which is probably enough to rule out the FRS radios.

For the Head of the Charles Regatta, we had 8 rescue launches this
past year. While some of the boat drivers were also hams, a number of
the units carried the driver, a ham, and a lifeguard, with room for
rescuees. A little tight, but the cold conditions in late October
demand a quick response. We also had hams at each of the first aid
stations, shadowing various race officials, at major boathouses, and
with mobile first aid teams out with the crowds, etc. Race officials
setting the course and watching for infractions were on a separate
system. Granted, this is one of the larger regattas, but the setup can
be scaled.

Recently we have added APRS, which transmits a signal from each launch
with its GPS location. This allows Net Control to have a visual map
showing the current location of each launch, to help in deploying the
closest one.

2147. Yaesu FT-530 Dual Handhelds - voltage mystery

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-01 13:40:07 UTC
From: Chris Anton <canton@mail.island.net>
Message-ID: <X_4de.1184814$6l.583098@pd7tw2no>
Source record: 15621

I've recently been fortunate to acquire two Yaesu FT-530 dual band handhelds which are really lovely radios after losing (hopefully just misplaced) my Kenwood. The challenge is that there is only one battery pack which takes 6 AA cells. Neither radio will power up connected to the pack. The pack puts out a full 9 volts. Connect up 12 volts and both radios work fine. I've cleaned contacts, jumpered the pack to a meter - 9 v, jumpered the pack to the radio - no go, jumpered the radio to 12v - works fine. I know I can order 12v packs but I'm perplexed why two units which according to spec will take 5.5 - 16 volt seem to be so picky. Anyone have an explanation?

cheers
Chris

Could that be Frontier Electric Co. Ltd of Japan? They sold an HF SSB transceiver. Only pix I
could find are here:
<http://www.qsl.net/la5ki/org/fe/500D.htm> I recall it was one of the first Japanese invasions into
the U.S. amateur market.

Is it possible that the pack with the AA cells uses the third contact
from the pack somehow
so the radio knows it's not a nicad pack?

Source record: 15625

See if the external power jack is making connection. It may
need to be exercised. It has a switch to isolate the internal
battery which does charge 7.5v batteries when run from Cigar
socket. I have found the external plug at Radio Shack. Radio
will work with anything from 5.5-16v but likes 7.5v -12v. Also
the one battery pack may be faulty. You could have 9v no
load that goes away as soon as you try to power up.

The 3rd contact is for charging and the AA clamshell will not
charge as Alkalines will explode. Replacement NiCads and
NiMH are available. I have always used the 7.5 v batteries
though to keep the heat down and charge from external power.
The watt or two never seems to make much difference.

By the way there is an internal voltmeter on the radio.

Welcome to usenet. We certainly enjoyed your posting and hope that your email address sales@aaarfproducts.com attracts some potential customers. I guess because you want to get email at sales@aaarfproducts.com ?

Why don't you post your catalog on your web site? Perhaps your web designer dallas@hyperartdesign.com would like to have a catalog, too, so they can do that. Or maybe raphael@hyperartdesign.com should get a copy so she can put it there.

In any case, thanks so much for stopping by.

The manual recommends that you NOT use the same 12v power source
as the transceiver. How is that possible. You mean I have to buy another
switching power supply for my home rig and another battery for mobile?

What is your interpretation of this statement in the manual and how did
you connect it to a power source?

Hi Richard...
I do not use my Heil CSS mobile so my only application is as a base station speaker. I purchased a Radio Shack 12v/500ma "wall wart" type power cube. It works fine and cost about $17. I am using a Radio Shack 12v/500ma (273-1773) adapter with the "H" (3.4MM)"adapta-plug".

If I would use it, I would use an in line power filter, and also use
shielded cable, with an audio ground loop adapter.

It looks like it is the pilot lamps after all. Being in series threw me off when checking the voltage. I had asked in another thread about where to buy them. Pretty expensive at $3.57 each when regular grain of wheat go for about 29-cents. Guess I will have to pony up the cash if I want them from the Kenwood distributor. Wish I could find a cross-reference.

Hello All,

For those who have visited my website on the slow QSLnet -
server, my page is moved to: http://pd0rkc.mine.nu

On my site I have hamradio info:

Antenna
International Space Station (active on 145.800Mhz FM).
Software
Kenwood (connector and reset info).
Coax (chart with many cables so you can compare loss).
DX information (realtime tropo and aurora maps).

Well if you know some information wich is not on my
website let me know!
I am looking for proffesional antenna calculation software!

73's Cor PD0RKC

You could get creative and try replacing them with LEDs of suitable color, (and with appropriate limiting resister). Usually works, and you'll never have a bulb go out again.

I took the easy (expensive) way out and ordered them from the Kenwood
west coast distributor. Ordered a service manual while I was at it.
The lamps were almost as much as the manual. :-(

Ditto on lamps for the TS-2000, six for $25.02 plus $8.50 shipping.
Expensive little things.

Charlie,

This unit costs $210!....and now you have to power it externally........

And add torroids ...."Each Heil Clear Speech is tested in 1.5KW system and is guaranteed to be free of any RFI as it leaves the Heil assembly plant. ANY RFI problem encountered must be rectified by proper installation, use of correct toroid cores or ferrite beads." Doesn't make sense....is it RFI proof...marginaly RFI proof...or not?......

One would think that for a $200 devise, we could ask the manufacturer to make this thing RFI proof....

One would think that for a $200 devise, we could ask the manufacturer to make this thing RFI proof....
I believe what they're saying is that if you have a bunch of cables (audio, power, etc.) that are full of RF, they sufficiently block it internally such that it doesn't affect the sound coming out of the speaker. However, there's really not much they can do to get rid of any RF on the cable insofar as it being picked up by _other_ equipment around your house, and it's here that one typically ends up with a bunch of ferrite cores around the cables as an attempt to reduce the RF on them.

I realize that $200 is a fair chunk of change for a lot of people, but I think it's quite reasonable considering what you're getting and the quantities they're likely producing them in.

I am looking for information on the 8950 vacuum tube and, in particular, the plate dissipation ratings. I would also like to find a datasheet, if possible.

Thanks.

A Specification data sheet available at:

http://www.pmillett.com/tubedata/8950.pdf

You're welcome.

Ed K7AAT

2185. FS IC-27H UHF Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-03 22:24:22 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <eSSde.825$DC2.319@okepread01>
Source record: 15708

FS Icom IC-27H 2 Meter 45 Watt Mobile Transceiver. This one has some bugs. It receives fine, display is bright and pretty with the mulitcolored lights, it transmitts full power output, it looks nice. But it will not produce any transmit audio. The mic keys the rig fine, but just no audio. Maybe a problem with the mic. Have not tried another mic. Also the On/Off Switch has a problem in that the transceiver will turn off and you have to thump the switch to get it to come back on. The switch feels tight, maybe it is just dirty.
Price is $45 in the lower 48. The original manual is included as is the power cord and the HM-23 Touch Tone Mic.
Thanks, Charlie Hugg, K5MBX

Lou I can see your point but how can Bob foresee every installation? What about the guy that places his Heil CSS on top of his AL-1500 and then complains about feedback from this "no good over-priced speaker?"

Every Ham should already have a clean and neat cable system and effective RF and electrical ground. And while I'm on my soap box...Radio Shack has 2 different ac power adapters that can power the CSS..and they range from $15 - $17. If you can afford $210 for a speaker but can't go the $15-$17 for the power source let me know..I'll send ya one! Sheesh...

Charlie,

This unit costs $210!....and now you have to power it externally........

And add torroids ...."Each Heil Clear Speech is tested in 1.5KW system and is guaranteed to be free of any RFI as it leaves the Heil assembly plant. ANY RFI problem encountered must be rectified by proper installation, use of correct toroid cores or ferrite beads." Doesn't make sense....is it RFI proof...marginaly RFI proof...or not?......

One would think that for a $200 devise, we could ask the manufacturer to make this thing RFI proof....

Source record: 15710

Although not exactly radio, I'm going to use it with my radios :)

I've aquired one of these dual deck slow speed logging recorders at auction. Anybody ever work on these things?? I need to get past the initial power up sequence, it seems to want a PIN which of course I don't have. Any admin passwords, etc to use?

Yeah, I know..longshot...

Thanks...Dennis

I don't agree that Heil is taking any "hits" with the CSS. I also own an AmCom Clear Speech Base Unit purchased about 3 years ago before Bob got into the development. It also did not come with a power supply and AmCom also strongly recommended that one use a separate power supply due to potential feedback issues. It cost me an additional $20 for a ps and ferrites and my CSS is feedback free even on HF with 1KW.

I used the Heil CSS last night with headphones plugged in while running a 2M SSB net wow what a treat!

My Icom 746 Pro with 32 bit IF -based DSP also does a great job at noise reduction. Even with that in place the Heil CSS -further- removes noise in the audio..some which may have been induced past the IF strip....

No antenna end noise reducer would catch that

If your SNR hasn't been well established long before the IF, you need a new
radio.

If your SNR isn't solidly established a long way ahead of the IF strip, you need a different radio.

Thanks , I guess I'll go borrow a book or two from the library tomorrow
and work out something with one of the pics I have , so far we have 40
watts on 6 with a good solid signal and great rx for $12.00 , Id like to
do something similar with the control :_) (kenwood tg601s x2 donation)

Dary, K8FP is selling some of his excess equipment.

Contact him at k8fp@woh.rr.com

Prices are firm and do not include shipping.

QRP Stuff:

Yaesu FT-817 in excellent condition. Comes with the original box, manual and all standard accessories including the MH-31 microphone. No mods have been performed. No batteries. This radio is guaranteed to work flawlessly on all bands. I am the original owner. $385.

Ten Tec 1320 20M QRP CW transceiver. Like new, works great and includes users manual. $60.

Elecraft K-1 QRP transceiver. This one is in like new condition and built well. Covers 30 and 40 meters. I'm the original owner. Comes with users manual. $140.

Super Antenna MP-1 portable antenna. Like new and in original box. Includes the 80M coil. $60.

QRO Stuff:

Kenwood TS-450 SAT. This radio is in excellent condition and no mods have been performed. All functions work like new. This radio has the built in auto tuner which also works flawlessly. Comes with the original box, manual, and hand microphone. $430. (I have run this rig and it's damn near mint de N8IE)

Kenwood TR-2500 2M FM HT. It's in great shape and works flawlessly. Comes with the ST-2 base stand (quick charger and power supply), SMC-25 speaker mic, SP-40 mobile speaker, 2 PB-25 batteries, leather case, manual and the Kenwood VB 2530 25 watt FM amplifier. All for $75.

MAHA MH-A103 2M amplifier. Drives at 2.5 to 5 watts in with 50 watts out. Covers 144 thru 148MHz and works great. Includes user manual. $50.

Please contact Daryl directly.

Guess I should have waited for the experts to chime in..after selling the 746Pro I drove to Atlanta last night so that this morning I could purchase my new Icom 7800 and PW1 matching linear.

This is a great group and thank you for the great advice.

Should I still hold on to my Midland 23 channel?? Hey it's hooked up to a TV sweep tube leenyar!!

2208. Alinco DR-610 heat?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-07 23:05:22 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <SQbfe.14797$tp.2121@fed1read04>
Source record: 15731

Anyone with a DR-610 out there? I've got one that seems
to like to run hot. It's always warm and when transmitting it
gets hot and stays hot for a long time after the QSO. Yes,
I checked the fan - it's running.

Rig works FB - I'm just worried it's going to burn up!

Help?

Thanks, Bart - Now that I think of it my old 706MkII got
this way, too. I read in the manual that the RF power level
is connected to a thermistor and the rig will cut power down
if the rig gets too hot. So, far, running remote base, cross
band repeat, echolink, SSTV & general use the rig has
gotten coffee cup hot but the heatsink didn't get too hot and
the power stayed at 100% of what I had it set to.

I guess it's just a cooker!

2210. FS Kenwood TS-440SAT

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-08 02:27:42 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <wOefe.1315$DC2.310@okepread01>
Source record: 15733

I have a nice Kenwood TS-440SAT for sale. It includes the original MC-43S hand mic and manual plus a nice copy of the Service Manual. Serial # is in the 9 million range. It looks very good. A couple of places on the edge of the trim ring where the paint has worn off, but overall it very clean. It works perfectly.
Antenna Tuner works well also. Very clear display. Price is $425. Thanks,
Charlie Hugg, K5MBX

Most all copper wire on the market is soft draw and will break after a few
years of constant tension. Hard draw copper wire is very tough and robust.
I use 18g lamp safety wire. This is the thin copper wire that servers as
a safety ground and as a safety wire in case a link in the lamp chain
breaks in hanging chandeliers.

I have 50' of thin braided copper wire from Home Depot that's been
under constant tension for 6 years 9 months. Enough tension to
deflect the top of a 20' support (two fence rails, a spike base and a
building clamp at 9') 2 to 3 inches.

2226. FS FT-227R and RA 2 Meter Transceivers

Would be a real deal if you would keep the cheap STEEL plastic coated wire
and just offer the insulators alone.....I like the wire ties you have on the
wire....made for tying reinforcment steel in concrete.....so is the cheap
antenna wire you offer with the insulators.

a BAAAAAAAD deal!

Hi all, I have a kenwood TR-7950. It does not have the factory PL unit.
I want to put a Com Spec board in it.
Does anyone know where the deviation pot is on this radio??
I understand I hook up the PL output to the center pin on the deviation
control.
Also, the "center tuning" LED works on some stations / repeaters but
not on all.
Is there a pot inside the radio to center this???

Hi, thanks for the info. I knew the Piexx unit was available.
I have a Com Spec PL unit here and wanted to use it instead of
spending the $60. I know the Piexx unit is the exact replacement
that allows the radio the 3 PL's. It would be nice but not needed in my
situation.
THANKS for taking the time for the answer!!!!

Please don't twist and turn anything without the manual if you are not a
bona fide (zat two werds) tech, EE or close to OM. Just passing on
experience me and my brother had 40 years ago. Now days, with
everything so small and tight, I only turn, push, or rotate things if
they are on ;the outside. : :-\

I'm posting this to r.r.a.s and here in the hopes someone might have
documentation on this 23cm power amp made by SSB ELECTRONIC in Germany.
If you have info on this amp or know of someone that might, pls e-mail
(or if you're in Germany and might be able to help with factory
contact, I'd be very grateful.)

Tks,

73 Dave WB0GAZ wb0gaz@hotmail.com

I had one that would cook the RX VCO away. I would unkey the TX and the RX would go away. It couldn't be fixed under warranty, so I took it back and got a Yaesu.

You will find it very numb if strung very close to the roof. Like
the
antenna, the ladder line will be very lossy if in close proximity
to the roof or other stuff. Which balun depends on each individual
matching situation. It is often easier for some tuners to tune from
a
higher impedance down to 50 ohm. Although a balun might reduce
stray RF in the shack with a resonant antenna, It might not with high
line SWR.

A resonant dipole would use a 1:1 fed with coax and a 1:4 fed
with Ladder line. If the antenna is pretty random, I would vote
for leaving the balun out until later.

You are actually no worse off putting it into the attic and standing
it off with insulators and as much air space as possible.

> a BAAAAAAAD deal!

Like the stainless steel messenger wire used in figure-8 CATV drops?
It has a plastic jacket and is made to support more than its own weight
for years. 100 foot drops of RG59 or RG6 are common and the messenger
wire will peel away from the coax. I had several thousand feet of it,
but my retired dad found my stash and has used all of it for his yard
and garden projects. The only bad thing is trying to solder to it, but
a clamp and N0-OX will take care of that.

From: Robb Leamy <rleamy@alltel.net>
Message-ID: <3b6e7$427eeacb$d8606e9f$10988@ALLTEL.NET>
Source record: 15567

I have a Lowe HF-150 with the outboard keypad. The keypad has stopped working. Now when a key is pushed there is no normal buzz. The pad has no effect. I think the pad operates a circuit internal to the receiver and likely the problem is located there. Anyone have this problem and solved it? Any ideas on what might be a possible cause wouldbe appreciated.
Tnx

My DR-610 turns the fan on the moment I touch the ptt - no matter what power setting, and keeps it running until I turn the power off.

I have another issue. When using the external speaker in my car I can hear a soft hiss when the power is off! This means it is drawing some current even then. How long will this "off" current take to drain my battery? I don't want to be stranded with a flat! The way its installed makes it impossible for me to measure the current (separate from any other "parked and the key out" current such as the clock). Is there a mod I can do so that "off" really is OFF or will I just have to get used to disconnecting it every time?

Other than that its a great rig with all the features I'll ever need, and then some!

Don't know if this is relevant to your problem; but my keypad dies when the supply voltage drops, even though the receiver works perfectly normally. I don't remember the specific voltage where the keyboard drops out, but it might be worth checking.

Good luck,
Dave

Can't you remove the Alinco inline power cable fuse and measure
the current there? You are running a fuse, right? Even if it is drawing
power, I doubt that it will draw enough to flatten your battery unless
you only run your car once a week.

Ken

Hello,

I'm trying to decide whether or not to repair the subject unit so I'd like to know what they've been selling for.

Mine has 1 watt output on UHF. (Final trans out?) The RX is fine and the VHF side also works well (45 watts)

I have the original box, with manual and the power cord and mounting bracket are brand new!

I would sell it like it is if I got a good offer.

Any input helpful.

Please reply by email.

Thanks, Gene (W5VAT)

I have for sale in their original boxes 4 Jan 811A tubes. These are the good ones, made in the USA and great for Collins 30L-1s.
All 4 were made by Electronic Enterprises. I have checked them out in my 30L-1 and they are full output, no gas.
Price is $100 plus shipping from 79602.
I also have a nice Turner 90D-4 Mobile Mic FS. It is just like a Collins MM-1. Since Turner made the MM-1 for Collins, it is the same mic with a Turner lable. Wired for Collins. Price is $75. Thanks, Charlie Hugg, K5MBX CCA #307

I am trying to connect my PC via a home made interface (with opto
couplers) to the CAT interface on the radio. When trying to connect no
response is received. After doing some measuring i find that the output
voltage at the TX lead of the FT857 is 5V without anything connected.
Is this normal, shouldn't it be 0V while not transmitting?
Does anyone have experience with this?

Check the capacitor at the output of the 8V regulator. If this cap goes bad,
this line will droop.

It's not uncommon for many stores in the US to have large mark-ups on what are really cheap accessories. For instance, in many of the big electronics stores, you'll see USB cables for, e.g., $9.95 when they're more like a couple of bucks mail order! This is something of a silly game, but given the significant competition for the 'big ticket' items (computers, printers, TVs, etc.), you can see why they do this.

Keep in mind that this is the same country where coffee shops selling lattes for $3/cup are still multiplying like rabbits. :-)

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Pioneer Scsii
CD changer. No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

they are very hard to find and as great as they are, I think they usually go
for more than they are worth
I have seen some AOR 7030's go for less. and R8B's occasionally go for just
a bit more.
I have a 225E and as much as I love it, I might trade it for a 7030 plus in
an impulsive moment.

I don't know how the 7030 sounds but the 225E is the best sounding receiver
of the over 100 receivers I have owned.

The Model 8200 FULL DUPLEX INTERCONNECT by Connect Systems Inc. is a sophisticated repeater controller with built-in semi or full duplex radio-telephone interconnect terminal. A built-in keyboard and digital display allow the user to obtain the maximum power from the on board microprocessor. All features are user programmable and/or selectable. There are six modes of operation to choose from... 1. Full or Semi-Duplex Base Station Interconnect Adds interconnect to any duplex base station. 2. Full or Semi-Duplex Repeater Interconnect Adds interconnect to any existing repeater system. Optional ANI validation allows shared use and includes deadbeat disable. 3. Repeater Controller with Duplex Interconnect Converts any receiver and transmitter into a full featured repeater. 4. Dial Access Remote Base Dispatch and have full use of your radio system from any telephone. Operates in any mode selected above. 5. Dial Access Paging Terminal Beep Pagers and/or selectively call mobiles with or without two way voice from any telephone. 6. Talk-Back Paging Terminal Beep pagers or mobiles followed with a one way voice message from any telephone. And, powerful built-in standard features such as... 90 number speed dialer, last number redial, remote hook-flash, remotely controllable relay, automatic disconnect on busy signals and dialtone, fully regenerated tone or pulse dialing, etc. make the 8200 the most powerful repeater controller/full duplex interconnect product available today! CTCSS Board (TSU-32P) installed. $175.00. USPS Money Order Only!. Compairable to the CS-800

From: k5dh@raytheon.com
Message-ID: <561he.1$ti4.0@dfw-service2.ext.ray.com>
Source record: 15652

Hello all,

Does anyone have the full specs on the Icom SP-20
and SP-23 speakers? There is no useful information
on Icom's web site, and this was the response I got
from Icom when I asked for more info:

"We do not have more than what is published on the
website about the SP20 and SP23 speakers, sorry."

Hmmm...

I know they both have several audio filter widths
and A/B inputs. But what makes one cost $50 more
than the other? Any info would be appreciated.

73,
Dean K5DH

2283. FCC BUST IN TEXAS

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-14 09:01:07 UTC
From: willfull_buck@yahoo.com
Message-ID: <1116061267.813336.214860@z14g2000cwz.googlegroups.com>
Source record: 15656

Hey Folks,
Kinda down at the moment, our college radio station got busted by the FCC. Here a list of the stuff that was hauled off:

NRG PLL-PRO 3 20W TRANSMITTER
NRG 220 WATT RF LINEAR AMPLIFIER
NRG PRO III STEREO CODER
NRG PRO III STEREO LIMITER COMPRESSOR
DAIWA CN-101L SWR+POWER METER
COMET CFM-95SL 5/8 WAVE ANTENNA
50 FEET OF LMR 400 COAX
KENWOOD R-1000 SW RECEIVER (my fathers old short-wave radio?)

The really weird part is that we WERE NOT transmitting at the time of the raid. One of the agents tolds us that they traced us through a purchase order from Broadcast-Warehouse! It's true that we bought a 150w amp from broadcastwarehouse.com a few weeks ago. How did the FCC know about that?

Anyways, we will rebuild the station and continue to fight the globle interests of the MEGA-MACHINE.

DEATH TO THE MEGA-MACHINE!

> purchase order from Broadcast-Warehouse! It's true that we bought a
> 150w amp from broadcastwarehouse.com a few weeks ago. How did the FCC
> know about that?

If the FCC was previously watching broadcastwarehouse.com for
selling things like non-type accepted amps, it would be easy to subpoena
their customer list.

> Anyways, we will rebuild the station and continue to fight the globle
> interests of the MEGA-MACHINE.
>
> DEATH TO THE MEGA-MACHINE!

Why so down on the FCC? Is your college station appropriately
licensed as a low-power FM broadcaster? If so, you may have legal
recourse to get your equipment back.

If your particular college has a branch that teaches
Administration of Justice, this may be a good time to consult with them.

If, on the other wing, your station was not licensed, you have no
one but yourselves to blame.

For the record: I don't see how a post like this is on-topic for
an amateur radio newsgroup, particularly one dealing with equipment.

I don't think so. They're both listed in Icom's current
catalog and all of the ham stores carry both.

sigh

I was wrong about inflation anyway. I see where the SP-20 is actually
more expensive.

Radio Shack is a convenience store for electronics, selling mainly
consumer electronics like cell phones and stereos. Components are a side
line. I buy stuff like wall warts from Mouser or Allied and get exactly
what I want, or better, find them at surplus stores for pennies on the
dollar/cents on the euro.

Repeated identical requests to the same Usenet newsgroup(s) are
very likely to piss people off enough so that they WON'T try to help
you.

Have patience. Once someone who can help notices your first post,
they probably will. HOWEVER -- Don't expect an E-mail reply. Keep an eye
on the newsgroup instead.

Happy hunting.

I've had a love affair with my old Kenwood TS-450sat since I bought my first one in the early 90's, but with Dayton looming, finally I got the go ahead from the XYL to upgrade. I've narrowed my choice down to a new Kenwood TS-2000 or a new IC-746 Pro. I know the features of both quite well, but I have read and heard a lot about the IC-746's problems with the IC-151 protection diodes and ESD (electro static discharge). I've seen what Icom has on their website about this problem, but wonder what current users think about it. I know there are a lot of IC-746 Pro owners out there, as well as TS-2000 owners, but I really would like to hear some HONEST opinions on this particular problem with the 746. Do many/any of you have repeat problems with the infamous 'no transmit' on the IC-746 due to the ESD issue? Has this problem been over blown? Is it still a problem, even though Icom claims they will repair it and already have it solved on the newer models?
I recently had the opportunity to play with an IC-746 and I was impressed. A good friend has a TS-2000 and I will get to play with it this week. But I am now looking for HONEST opinions on both units, especially the 746.
Thanks!

I want to install a 2 meter rig in my wife's 2000 Focus. Underneath the aftermarket Pioneer radio there is a clutter catcher that I want to take out to install the new rig.
I am wondering how hard it is to pull off the metal plate in the lower center of the dash....thanks for your help.

RATELCO Battery charger / Rectifier. Type FC48-1505A
Model # 102B-3608-00. 48 Volt @ 150 Amps, Float or Equalize.
These units were manufactured SEPT 1991 and are in the Factory
crates and have Never been used, have 2, sequential Serial numbers.
Cost new $ 6000.xx
These units can be used as 48 volt charger for Telephone Central
Office Battery supply's with the ability to Float or Equalize.
They can also be used as a stand alone, well filtered, power
supply rated at 48 volts at 150 amps CONTINOUS DUTY.
Input = 110, 208, 240 Volts. 60 Hz, single phase
A must for the expirimenter working with the new generation
of 48 volt solid state RF devices Rated in excess of a Kilowatt.

Weight is approximately 550 pounds, Crated for freight shipping.

$1500.xx Each, O.B.O. Prepaid,In my garage.

Moving by the 27 of May, Hate to see these scrapped

NEW LOW PRICE $1000.xx each, Prepaid,In my garage.
buyer pays freight from my driveway in Merritt Island FL 32953

Loading and shiping are buyers responsibility.

I researched for many months before making my decision to go with the IC746Pro over the TS2000. I certainly haven't regreted it this past 18 months. One thing that I certainly find superior in the ICom is the DSP unit. It makes digging signals out of severe noise a dream.

Jim-

I went through the comparison bit a couple of years ago, only between the TS-2000 and the IC-756 Pro II. I chose the Icom primarily because of the impressive spectrum display.

Just playing with the radio may not be enough. The IC-756 works fairly well in most respects, but when I went to program its memories, I found that it did not have the capability of storing repeater frequency pairs. Since my intended use includes several local 6 Meter repeaters including two different splits, this shortcoming makes it impossible to quickly switch between repeaters.

I had never encountered a recent model radio that had this shortcoming. Even my old IC-706 (original) could store all the necessary frequency and tone data in each memory location. If this matters to you, be sure to check the 746 to see if it has the same problem.

The 746 Pro certainly has some issues but the TS-2000 has one of the
worst front ends you can stick yourself with.

Do a Google search on the two speakers and it will take you to
Universal Radio's site -- they have decent specs there.

I have a big Yeasu speaker with audio filters and they are fairly
useless. I can't imagine Icom's being much better, if at all.

If I were spending money in this price range, I'd look at the new
version of the Clear Speech speaker at Heil -- you can at least call
them and talk to the man himself.

2328. FS Kenwood Marine/HF Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-17 01:59:56 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <WGcie.3118$DC2.549@okepread01>
Source record: 15502

I have a Kenwood TKM-707 Transceiver that is brand new in the box. It has the amateur radio mods performed by the dealer. These modifications are very simple and easy to change back to the original factory specifications. They allow the TKM-707 to transmit from the "VFO" dial as well as from memory and allow lower side band as well as upper side band operation. This makes for a versatile transceiver useful for the ham operator as well as the marine operator. Documentation of the modifications performed is included.

The TKM-707 is a high performance SSB radio telephone transceiver designed to meet the stringent demands of the marine market, both in quality and ruggedness. This transceiver utilizes a heavy-duty rust-proof aluminum chassis and the highest quality parts to maximize performance. Output power is 150 watts. It has 198 memories, a large efficient cooling system and dual mode noise blankers. It transmits from 2 MHz to 23 MHz, and it receives general coverage shortwave frequencies from 500 KHz to 30 MHz. It meets all US coast guard requirements for commercial vessels. Price is $750. They retail for $1499. AES is running a sale on they for $1249.
Digital pictures available upon request. Thanks, Charlie Hugg, K5MBX

FS Kenwood PS-430 Power Supply in very nice cosmetic and working condition for $85. I also have a Kenwood SP-430 Speaker for sale for $50. It has a few nicks and scratches, but not band. Shipping extra on both items. Thanks, Charlie Hugg, K5MBX

2333. Wanted: Icom SP-20 speaker

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-17 12:22:30 UTC
From: k5dh@raytheon.com
Message-ID: <amlie.3$T45.0@dfw-service2.ext.ray.com>

Looking to buy an Icom SP-20 speaker to go with
my 746PRO. Must be in nice condition (doesn't
have to be "flawless", just nice) and it must
come from a non-smoking environment. Would be
desirable to have the box and manual, but not
having them isn't a show-stopper for me.

Thanks and 73,
Dean K5DH

>k5qwg

Thanks for the lead, Bob. Not sure why I didn't find this when I Google'd the other day, but it's definitely there. Operator error, I'm sure. It's interesting that Universal has such good information but Icom doesn't!

As for the usefullness of these type of filters, I guess that's a matter of personal preference. In addition to my 746PRO, I also have a Kenwood TS-850SAT with the matching

SP-31 speaker. It has three audio filters, and I use them fairly often. I especially like the high-cut filters when the static gets loud. They take the edge off.

73 and thanks again for the lead!

Dean K5DH

Even hard drawn copper stretches with time.

Copper clad is not that bad if the cladding is thick enough. A vendor
can improve profits if the copper cladding is kept to bare minimum.
There are two real problem with copper cladded steel. One is the
plating process itself. If it is not uniform and thick enough t hen
mositure can penetrate the copper plating and cause the underlying
steel to rust. Once that happens the radiation resistance goes south
big times. The second issue is that any protective coating on the
copper is missing or damgaed will cause copper to oxide. Copper
oxides are not conducting. The antenna performance then goes south in
a big hurry.

Even hard drawn copper is subject to oxidation if not protected. While
the effects of copper oxides on the very thin surface is marginal at
frequencies below 30 MHz., they can be disastorous at frequencies in
the VHF regions and higher.

2353. 400Hz Servomotor

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-17 21:53:17 UTC
From: IZ5FCY Roberto <iz5fcy_NOTRASH@arrl.net>
Message-ID: <1ray1r0l2atkx.1rvt5if481pec.dlg@40tude.net>
Source record: 15526

Hi to all!
I need if your help.
I have a lot of 400Hz Muirhead Servomotor-Tachometer generator mod.
15M81A,fom Mil surplus.
For 400Hz supply isn't a problem but I Don't have idea how to apply or
drive this servomotors.
This motor is supplied with a 115Vac primary plus two 13Vac control
windings, one tachometer 115 Vac primary with a secondary output.
Do you have some suggestion, scheme, application notes for use this motors
in a light CNC project?
Will be welcome application notes, schematic, literatures or URL's for
this devices..

I please you to reply by email, many thanks in advance and sorry for
bandwidht..

Ciao from Italy....

2360. Wanted to buy or trade: MFJ 971 and MFJ 415B

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-18 02:19:12 UTC
From: Paul Jordan <pauljordan@gci.net>
Message-ID: <118l9p8p7hompf1@corp.supernews.com>
Source record: 15533

I'm looking for a MFJ 971 tuner and also a MFJ 415B CW conversion for my MFJ 9420. If you have either or both, I'm very interested. Possible items I may trade include an MFJ-9020 CW transciever, a Yaesu FR-101S Reciever or a Kenwood TS-130 with a matching AT-130.

I may also be interested in other MFJ 94xx transcievers in bands other than 20 meters.

What can I say, I like the radios and I need them small and portable for my travels.

Let me know what you have and let's DEAL!!

2361. Knight Star Roamer

Hi all. My sister is currently in Salt Lake City and needs to buy a 240V-110V step-down transformer, and they'll be *WAY* cheaper there than back this side of the date line. Anyone have any clues where she can go to to get one there? (In a pinch she could get one from Frys on-line, but for one small item I'm loathe to try and get her to do that).

Cheers.

Ken

REI has a store there, and they have a number of travel accessories.
In the local ones, I have seen the kit with the transformer and the
various non-US plugs.

Happy trails,
Gary (net.yogi.bear)

Probably true. Most of the newer speakers sound pretty "tinny".
I mainly use headphones. You can plug fones into the SP-20 and
SP-23 and use the audio filters. That's what I have in mind.

I have a 10" speaker in a slope-front Bud cabinet that I use
with my SX-101A. Plate-modulated AM signals sure sound nice
with that combination! :)

The memo that has "IMPEACH HIM" written all over it.

The top-level government memo marked "SECRET AND STRICTLY PERSONAL", dated eight months before Bush sent us into Iraq, following a closed meeting with the President, reads, "Military action was now seen as inevitable. Bush wanted to remove Saddam through military action justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy."

Read that again: "The intelligence and facts were being fixed...."

For years, after each damning report on BBC TV, viewers inevitably ask me, "Isn't this grounds for impeachment?" -- vote rigging, a blind eye to terror and the bin Ladens before 9-11, and so on. Evil, stupidity and self-dealing are shameful but not impeachable. What's needed is a "high crime or misdemeanor."

And if this ain't it, nothing is.

The memo uncovered this week by the TIMES, goes on to describe an elaborate plan by George Bush and British Prime Minister Tony Blair to hoodwink the lanet into supporting an attack on Iraq knowing full well the evidence for war was a phony.

A conspiracy to commit serial fraud is, under federal law, racketeering. However, the Mob's schemes never cost so many lives. Here's more. "Bush had made up his mind to take military action. But the case was thin. Saddam was not threatening his neighbors, and his WMD capability was less than that of Libya, North Korea or Iran."

Really? But Mr. Bush told us, "Intelligence gathered by this and other governments leaves no doubt that the Iraq regime continues to possess and conceal some of the most lethal weapons ever devised."

A month ago, the Silberman-Robb Commission issued its report on WMD intelligence before the war, dismissing claims that Bush fixed the facts with this snooty, condescending conclusion written directly to the President, "After a thorough review, the Commission found no indication that the Intelligence Community distorted the evidence regarding Iraq's weapons." We now know the report was a bogus 618 pages of thick whitewash aimed to let Bush off the hook for his murderous mendacity. Read on: The invasion build-up was then set, says the memo, "beginning 30 days before the US Congressional elections." Mission accomplished. You should parse the entire memo -- reprinted below -- and see if you can make it through its three pages without losing your lunch. Now sharp readers may note they didn't see this memo, in fact, printed in the New York Times. It wasn't. Rather, it was splashed across the front pages of the

Times of LONDON on Monday.

It has effectively finished the last, sorry remnants of Tony Blair's political career. (While his Labor Party will most assuredly win the elections Thursday, Prime Minister Blair is expected, possibly within months, to be shoved overboard in favor of his Chancellor of the Exchequer, a political execution which requires only a vote of the Labour party's members in Parliament.)

But in the US, barely a word. The New York Times covers this hard evidence of Bush's fabrication of a casus belli as some "British" elections story. Apparently, our President's fraud isn't "news fit to print."

My colleagues in the UK press have skewered Blair, digging out more incriminating memos, challenging the official government factoids and fibs. But in the US press nada, bubkes, zilch. Bush fixed the facts and somehow that's a story for "over there."

The Republicans impeached Bill Clinton over his cigar and Monica's affections. And the US media could print nothing else. Now, we have the stone, cold evidence of bending intelligence to sell us on death by the thousands, and neither a Republican Congress nor what is laughably called US journalism thought it worth a second look.

My friend Daniel Ellsberg once said that what's good about the American people is that you have to lie to them. What's bad about Americans is that it's so easy to do.

SECRET AND STRICTLY PERSONAL - UK EYES ONLY
DAVID MANNING

From: Matthew Rycroft

Date: 23 July 2002 S 195 /02

cc: Defence Secretary,Foreign Secretary, Attorney-General,
Sir Richard Wilson, John Scarlett, Francis Richards, CDS, C,
Jonathan Powell, Sally Morgan, Alastair Campbell

IRAQ: PRIME MINISTER'S MEETING, 23 JULY

Copy addressees and you met the Prime Minister on 23 July to discuss Iraq.

This record is extremely sensitive. No further copies should be made. It should be shown only to those with a genuine need to know its contents.

John Scarlett summarised the intelligence and latest JIC assessment. Saddam's regime was tough and based on extreme fear. The only way to overthrow it was likely to be by massive military action. Saddam was worried and expected an attack, probably by air and land, but he was not convinced that it would be immediate or overwhelming. His regime expected their neighbours to line up with the US. Saddam knew that regular army morale was poor. Real support for Saddam among the public was probably narrowly based.

C reported on his recent talks in Washington. There was a perceptible shift in attitude. Military action was now seen as inevitable. Bush wanted to remove Saddam, through military action, justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy. The NSC had no patience with the UN route, and no enthusiasm for publishing material on the Iraqi regime's record. There was little discussion in Washington of the aftermath after military action.

CDS said that military planners would brief CENTCOM on 1-2 August, Rumsfeld on 3 August and Bush on 4 August.

The two broad US options were:

(a) Generated Start. A slow build-up of 250,000 US troops, a short (72 hour) air campaign, then a move up to Baghdad from the south. Lead time of 90 days (30 days preparation plus 60 days deployment to Kuwait).

(b) Running Start. Use forces already in theatre (3 x 6,000), continuous air campaign, initiated by an Iraqi casus belli. Total lead time of 60 days with the air campaign beginning even earlier. A hazardous option.

The US saw the UK (and Kuwait) as essential, with basing in Diego Garcia and Cyprus critical for either option. Turkey and other Gulf states were also important, but less vital. The three main options for UK involvement were:

(i) Basing in Diego Garcia and Cyprus, plus three SF squadrons.

(ii) As above, with maritime and air assets in addition.

(iii) As above, plus a land contribution of up to 40,000, perhaps with a discrete role in Northern Iraq entering from Turkey, tying down two Iraqi divisions.

The Defence Secretary said that the US had already begun "spikes of activity" to put pressure on the regime. No decisions had been taken, but he thought the most likely timing in US minds for military action to begin was January, with the timeline beginning 30 days before the US Congressional elections.

The Foreign Secretary said he would discuss this with Colin Powell this week. It seemed clear that Bush had made up his mind to take military action, even if the timing was not yet decided. But the case was thin. Saddam was not threatening his neighbours, and his WMD capability was less than that of Libya, North Korea or Iran. We should work up a plan

for an ultimatum to Saddam to allow back in the UN weapons inspectors. This would also help with the legal justification for the use of force.

The Attorney-General said that the desire for regime change was not a legal base for military action. There were three possible legal bases: self-defence, humanitarian intervention, or UNSC authorisation. The first and second could not be the base in this case. Relying on UNSCR 1205 of three years ago would be difficult. The situation might of course change.

The Prime Minister said that it would make a big difference politically and legally if Saddam refused to allow in the UN inspectors. Regime change and WMD were linked in the sense that it was the regime that was producing the WMD. There were different strategies for dealing with Libya and Iran. If the political context were right, people would support regime change. The two key issues were whether the military plan worked and whether we had the political strategy to give the military plan the space to work.

On the first, CDS said that we did not know yet if the US battleplan was workable. The military were continuing to ask lots of questions.

For instance, what were the consequences, if Saddam used WMD on day one, or if Baghdad did not collapse and urban warfighting began? You said that Saddam could also use his WMD on Kuwait. Or on Israel, added the Defence Secretary.

The Foreign Secretary thought the US would not go ahead with a military plan unless convinced that it was a winning strategy. On this, US and UK interests converged. But on the political strategy, there could be US/UK differences. Despite US resistance, we should explore discreetly the ultimatum. Saddam would continue to play hard-ball with the UN.

John Scarlett assessed that Saddam would allow the inspectors back in only when he thought the threat of military action was real.

The Defence Secretary said that if the Prime Minister wanted UK military involvement, he would need to decide this early. He cautioned that many in the US did not think it worth going down the ultimatum route. It would be important for the Prime Minister to set out the political context to Bush.

Conclusions:

(a) We should work on the assumption that the UK would take part in any military action. But we needed a fuller picture of US planning before we could take any firm decisions. CDS should tell the US military that we were considering a range of options.

(b) The Prime Minister would revert on the question of whether funds could be spent in preparation for this operation.

(c) CDS would send the Prime Minister full details of the proposed military campaign and possible UK contributions by the end of the week.

(d) The Foreign Secretary would send the Prime Minister the background on the UN inspectors, and discreetly work up the ultimatum to Saddam. He would also send the Prime Minister advice on the positions of countries in the region especially Turkey, and of the key EU member states.

(e) John Scarlett would send the Prime Minister a full intelligence update.

(f) We must not ignore the legal issues: the Attorney-General would consider legal advice with FCO/MOD legal advisers. (I have written separately to commissionthis follow-up work.)

(a) We should work on the assumption that the UK would take part in any military action. But we needed a fuller picture of US planning before we could take any firm decisions. CDS should tell the US military that we were considering a range of options.

(b) The Prime Minister would revert on the question of whether funds could be spent in preparation for this operation.

(c) CDS would send the Prime Minister full details of the proposed military campaign and possible UK contributions by the end of the week.

(d) The Foreign Secretary would send the Prime Minister the background on the UN inspectors, and discreetly work up the ultimatum to Saddam. He would also send the Prime Minister advice on the positions of countries in the region especially Turkey, and of the key EU member states.

(e) John Scarlett would send the Prime Minister a full intelligence update.

(f) We must not ignore the legal issues: the Attorney-General would consider legal advice with FCO/MOD legal advisers. (I have written separately to commissionthis follow-up work.)

Anything you can send over the internet you can send over packet.
Don't think 2400 bps, think at least 9600.

Hi

I will be taking my Foundation Licence exam next week. I want a small hand held rig to start with which covers the 70cms and 2 metre bands.

Has anyone any comments on a Yaesu VX-1.

Has anyone got some ideas for other suitable rigs.

2382. Re: Yaesu VX-1

Newsgroup: rec.radio.amateur.equipment

Source record: 15455

The VX-1 is ok, BUT the VX-2 is much better!
One thing is to get another antenna, I have several different types,
from a 3" rubber dual bander to one that is very flexible at 19".
TheVX-2 is nice that it can also recieve the AM/FM broadcast bands, and
has more than enough memory for you to store your favorite frequencies.

Hi,

I have to test this propagation pgm from NAVY
"Advanced Refractive Effects Prediction System - AREPS"
available for free at http://sunspot.spawar.navy.mil/

I don't know it really.

Do you know how it performs ? Or its drawback(s) or any feature I had to
check closer ?
Any review or comment is welcome to get an idea of where I put my feet ;-)

Thanks in advance

2386. wanted Mike&cord for AZDEN PCS3000

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-19 23:46:50 UTC
From: Joseph Fenn <jfenn@lava.net>
Message-ID: <Pine.BSI.4.61.0505191338110.8238@malasada.lava.net>
Source record: 15459

This rig uses a mike cord and female receptacle with
4 by 4 (total 16 receptacle pins) which plugs into the front
of the rig. I have no idea where or who would sell such a plug and
mike cord! Reason so many pins involved is the Mike has buttons
for "scanning" the 8 memory chnls, push to talk, mike audio out,
scan up/down, and "favorite mem chnl" also push to talk.
The receptacles in the plug have been cleaned many times with
"deoxit", and with tiny screwdriver have been burnished, but still
requires frequent attention to get it to function properly with just
push to talk. I would buy the entire rig just to get the
mike and cord!

hello all,

before it goes to the auction place, i am offering for sale a Swan 400
with matching 420 vfo. also included is a National power supply.

the rig is in decent shape cosmeticly. the rig does power up but i have
not transmitted with it. receive is low. i have not gone through this rig
and have more projects than i care to deal with. no manual.

price is 150.00 PLUS shipping from 33830. if no one wants it here, i
will split it up and auction it off.

digital pictures upon request.

best 73.

These are the problems I had with my VX-1:
Bad battery contact (lid of battery compartment) causes the VX-1 to
occasionally switch itself off.
In one of these incidents all parameters settings (S meter and squelch
levels) went haywire and I had to reprogram them all.
Bob stated the VX-1 would not receive AM/FM broadcast. Mine definitely does!
There is free software around which makes it easy to fill the VX-1 memories
via the PC.
I still like my VX-1 because of its small size. Its power of 0.5W is
sufficient for my purposes.

Heh, where did I say that the VX-1 does NOT recieve AM/FM broadcast
band??? You're putting words in my mouth.

Also with the VX-2, you can purchase battery packs, and chargers for
much less than you would have to pay Yeasu.... Look on Ebay...

Interesting enough about this subject, but if an unlicensed station is on the air its the FCC's job to remove off the air and prosecute any offenders taking part in this regardless of whos doing it, students or otherwise.

Here in Bryan last summer there was a small pirate station near the campus, but it operated for months till the washington liberals came and installed they're hitler youth group on them!

My voice is let the small radio stations alone, yes if they are violating air space or commercial interrference on the public, yes shut them down, otherwise leave be!

Tell me, what kind of name is Anton Squegge?

I think I could have gotten a little more creative than that!

Like Mr. Fillibuster or

Mr. Weiner

or Mr. Notch?

Use your mind!

Doug, KR4K.

Consider that 2400 bps is 240 bytes per second. A standard jpg photo
might be 48 kb (kilobytes). (For a nice round number.) So that
would take 200 seconds to transmit.

Assuming some overhead which is why I rounded 2400 bps to 240 bytes
per second. I'm not at all familiar with packet radio but am
familiar with phone line modems. There could be lots more overhead
with packet radio which I'm not aware of.

Thus while you could send video it could take several minutes per
frame.

Yup.

Or, really, it could take very much longer at 2400 bits/second,
because you're going to have to wait for a long time to find another
ham packet-radio user with a 2400-baud modem! As far as I know, there
are no real or de facto standards for 2400-baud operation on the ham
bands... any such modems are likely to be experimental one-offs.

The original standard is 1200 baud, based on the Bell 202 AFSK (audio
frequency shift keying) modem standard. There were a lot of
202-capable modems sitting around (e.g. older Hayes models) when the
hams started playing with this. A lot of packet radio is still using
these, despite their low bandwidth, as they're cheap to implement, and
can be hooked to a 2-meter radio with little more than a bit of
isolation (cheap audio transformers, or capacitors) and a PTT-keying
circuit.

9600 baud is the next common step up, using FSK (shifting the RF
carrier frequency more directly, without an audio-frequency carrier).
The modem itself can be very simple and cheap, but the hookup to the
radio is more involved - you must bypass many of the audio input and
output circuits (preemphasis and deemphasis) and feed the signal to
the modulator fairly directly. Older radios must usually be modified
to support this. Newer ones often have an auxiliary/data jack with
pinouts for both 1200 and 9600, and a switchable control via a menu.

Even higher speeds have been played with, but they tend to require
more-specialized radios, or radios with the modems/TNCs integrated
into 'em.

As to sending the data... you've got several ways of doing it. You can use the traditional AX.25 packet protocols, which are usually designed to let you log into a BBS or remote node, and then implement a file-transfer capability on top of these... that's how packet BBSes interconnect. Or, you can run TCP/IP directly on top of AX.25., and use any file transfer protocol you want (HTTP, FTP, etc. - SSH would probably violate the FCC's rules, though).

Then, there's the traditional analog slow-scan TV, and some new digital slow-scan TV methods with built-in forward error correction.

There are some interesting soundcard-based modulations such as SCAMP, which mandate a file-based transfer methodology rather different than AX.25 packet. SCAMP is designed for use on HF, but could almost certainly be transmitted over 2-meter FM or 2-meter sideband just fine.

Anybody out there know what param to change in the "setup" of winlink
so it will accept connections via a digiptr? Was told by one guy
that winlink2.9 cannot accept connections via digipeaters.
I question this and assume that party just dont know that winlink
supports all ax25v2 protocol cmds and capabilities, as does
AIRMAIL also. If someone knows what to change in the setup file
(params settings) let me know. I know it has a digiptr on/off toggle,
but that refers to the the particular station thats running a bbs.
If the thing is toggled on then even his stn could act as a
digiptr itself. What in winlink bars connections from other
stns via digiptrs??

I'm looking at a used TS-450S with Serial Number 30300519 that seems in very good shape.

Can you tell me:

(1) What is the likely date of manufacture of this rig? I'm hoping to avoid an early production unit that may have some inherent weaknesses...
(2) What are likely problems that this radio has experienced over the years that I should watch out for?

Thanks 73 Kevin VE9XYZ

Joe :

Whilst I don't use Winlink a quick check of their features page at:

http://winlink.org/features.htm

Seems to indicate you may nee to look at TelPac and PacLink to make this
work.

Hope it helps a bit. :)

Kevin-

I've also been looking for a TS-520/530, and was hoping someone would respond to your question with a web reference to its history. It would be nice to find a 530 with the built-in DC supply, if they exist.

As far as the TS-450 is concerned, I have the TS-690, which is a TS-450 with Six Meters. I purchased the optional internal tuner with mine, as well as the TCXO high stability oscillator, the CTCSS tone generator and three additional filters. Does the one you are considering have any such options?

I forget how old it is, but it was bought soon after it came out. I have had absolutely no problems with it. I recently replaced the CMOS battery because of age, not because it had failed. My only complaints might be that use of the noise limiter seems to introduce distortion originating from strong foreign broadcast stations, and that the CTCSS tones are jumper-selected.

The TS-450/690 was replaced by the TS-570/570S several years ago, which was joined later by the TS-2000. The recent TS-480 is sort-of a cross between the TS-570 and the TS-50, but could be considered a replacement for the TS-570. If you are looking for a good used Kenwood, I'd recommend also considering the TS-570.

I bought a DJ-596T handy at Dayton that won't transmit.
(Not that it was misrepresented, both the seller and I discovered it had a problem.)

Anyway, it visually appears to work, that is to say when keyed down the red TX light and the LCD bar graph come on but there is no transmission made. This is true for both 2m and 70cm.

It receives perfectly on both bands.

I downloaded the service manual from Alinco but it's description of the TX circuit is limited at best. I'd like to take a try at fixing it before sending it off for repair. Anyone here able to suggest where I should be looking for the offending component?

Thanks for reading!

Hi,

TS-530 did not have the dc power supply option like the kenwood ts-520.

I have a great used ts-530s from ebay (trusted seller, lots of used gear)
that works just great. No problems with it at all.

As long as the radio has been used all these years just fine,
if it has been in storage, you may have to replace the filter caps (2)
for the hv ps. Digikey and mouser have them.

come on over to the kenwood forum (all welcome)

http://groups.yahoo.com/group/TS-520_820_530_830/

2434. Kenwood TS-450S S/N Query (Sorry guys, misspelled it in the original post)

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-23 14:49:37 UTC
From: "K. Hastings" <myfamilydotcom@hotmail.com>
Message-ID: <54mke.35082$Ph4.666200@ursa-nb00s0.nbnet.nb.ca>
Source record: 15407

I'm looking at a used TS-450S with Serial Number 30300519 that seems in very good shape.

Can you tell me:

(1) What is the likely date of manufacture of this rig? I'm hoping to avoid an early production unit that may have some inherent weaknesses...
(2) What are likely problems that this radio has experienced over the years that I should watch out for?

Thanks 73 Kevin VE9XYZ

myfamilydotcom@hotmail.com

PS (I asked this question over the weekend and misspelled TS-450S - sorry about that; It's the TS-450S that I'm asking about)

2435. <<WANTED>> Motorola console for car or truck

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-23 16:36:37 UTC
From: WØCBF <w0cbf@yahoo.com>
Message-ID: <1116866197.782405.304980@z14g2000cwz.googlegroups.com>
Source record: 15408

I posted this message several months ago and had several direct answers stating they knew what they were and that some of the responders had some for sale. I did find one locally but now I am looking for another one.

Here is original message: Back in the mid 70's Motorola made a console that would fit between the driver and passenger seat. It was made of a black plastic and the main use was to mount a rig on the front causing the face of the rig to face the top of the car at a slight angle for easy viewing and the rear of the rig would fit over the seat. It also contained a place for an internal speaker and a center console area that would open for storage or could be used for writing if closed.

Does anyone remember these consoles (or have I lost my mind!!!).
If so does anyone know I could find one to purchase (used but in good condition) OK?

I tried eBay already and have never seen them listed.

Thanks
Chuck

I traced the fault to the EJ-43U board. The rig works perfectly with it removed.

I know it's only needed for digital mode, but it might be nice to try it out. Anyone ever see an EJ-43U board for sale lately?

Thanks again for reading!
Pat

Source record: 15419

I've had 2 since 1992, both manufactured around the same time. The one I have now is S/N 30900515. So I assume the one you are looking at is a bit older. I did just buy a TS-2000 at Dayton to replace it, a difficult decision. Both 450's have been rock solid and problem free. The only thing to worry about, and it's not a major issue, is the battery backup. Life expectancy is probably around 10-15 years (my second radio's lasted 12 years) and regardless of what people say, it's no easy task for the average 'Joe' to replace it. Certainly with the right tools, steady hands and good eyes, you can do it.
It may be an older radio, but I think it's one of the better ones.

Why not drop in an LED (with a suitable dropping resistor)?
I've done that with several older era rigs with good success.
And, in battery operation, your current draw drops.
If you get too much of a "spot effect" in back lighting, roughen
up the front of the lens a wee bit with emery paper.

it wouldn't have been hard to re-convert it back to 10 only and use it where
designed.

ah well. guess you can't have everything.

Hey all,

Still have some stuff left over.... looking to trade.

VHF Saber II [ready to convert to S-III w/case], rap-chrgr, batt.

VHF P1225, 16ch. DISPLAY, DTMF, etc. charger, batt.

UHF GP350, 16ch., GP300 accy adapter, chrgr, batt.

Maratrac drawer unit only, 46-50Mhz? [T81XTA7TA7BK], good condition with 'siren mount holes'. No tray.

VHF Spectra, 110w, HHCH, drawer, cables, siren and siren cable.

800mhz STX radios, 3ea. good, bad, ugly, but working.

Will consider trades on anything of value. [anything fun or dangerous, that is...]

Don't need LED's, lights, sirens, fire gear, old radios, rare/collector's items or similar.

Considering
hiking/camping/GPS stuff
bass guitar related
touring motorcycle gear/related
Guns
small enclosed/larger open trailer, etc
Golf carts, tractors, dirt bikes or whatever,
I'll meet ya somewhere within a state or two of WV if need be.
Digital photos available for the serious.
thanks!
Randy

No, but the $25 entrance fee was new to me, as was the $10 shuttle ride. Haven't been there in a few years, but I asked the management to kiss me goodbye this time, since I don't intend to get raped twice. Would estimate that attendance is down 30-40 percent from Dayton's hey day. Still the biggest, but plenty of room both indoors and outdoors. If the League hadn't taken an entire wing of the inside, there would have been an echo in there. Another year or so of this and Shelby will be the king of the hill and Dayton will be a memory.

Never been to Dayton during the ham fest (was there Oct couple years ago
for another convention) and I would have liked to see it in its heyday,
but alas it sounds depressing now.

I used to attend the HOSS TRADERS hamfest in New Hampshire years ago
when I was stationed in Maine. It was HUGE and covered almost all of the
facility they rented (some kind of Fairgrounds).

Alas here in Washington State Ive yet to find one even close to either
of these

Here Here.... a few years ago I waved my hiney bye bye to Dayton.
With the $100 or so I would have spent for tickets food parking drinks and
other items
long before making any purchases. I have bought many items radios test
equipment etc from ebay
and other sites.
The last time I was there they even charged the handicap $8 to park. And it
wasn't even close to the
doors.

Anyhow I still wave it around that weekend so they can blow it a kiss when
they run out of visitors.

DE WB9SMX 73
bye bye yall

Hummmm.....! Well mine is 70900079 and it are a super
little rig, however, I would never use mine as a mobile rig except in an
emergency situation. I'm trying to find out when I got mine. It was
used, but it was in "as new" condition. I have never heard anything BAD
about the 450 except from the few duds that allways seem to have owned
every rig made since Marconi built his, or had his built.

I've got 2 Turner mikes that I'd like to clean up.... a +3 Sidekick, and a near identical one without the preamp (manufactured by Telex).

I cannot figure out how to dissemble the mic element part (the part that sits at the top of the mike stand). Is there a trick?

Don't know too much about the Icoms at all...must admit I'm a Yaesu guy.

Do you have the manual on paper or on the computer?
Do those instructions work or does there seem to be something wrong with
the radio....

> Bradley, Can you do magic to 02-ATs? The one I bought wrat here
> on r.r.a.e don'e work. I t operates simplex only. Can't

You have some great rules, this is one I really like:

"One thing we don't allow at the Shelby Hamfest is long winded speeches."

Sounds like a fun place to be on Labor day weekend.

Been there, done that...

On Plus Three and Sidekick desk mics, you have to pry the
little Turner emblem off the rear of the mic head to expose
the Phillips screw that holds the mic element assembly into
place. There's another Phillips screw inside the head that
holds the head onto the neck. You'll see it once the mic
element assembly is out of the way.

No such good luck here Brady, the rig came to my door broke, I
downloaded the Service Manual and re-set the cpu, or what ever gets
re-set when you push the little button on the inside of the rig. I have
been a fortunate man when it comes to selling and trading on the
usegroups, but a lousey record when it comes to buying on it.
I've been told before that "it happens", and sure enough "it do"!

ICOM announced the replacement for the IC-706, the IC-7000.

For one thing, it has 500 memory channels.

2498. Lil help for my Yaesu 757 GX II please

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-27 06:21:35 UTC
From: Mr Fed UP <mrfedup@bellsouth.net>
Message-ID: <NUyle.33383$CR5.13356@bignews1.bellsouth.net>
Source record: 15321

Does anyone have a hint on what might be binding up my Yaesu 757 GX II freq
dial.
It worked for a while from ebay purchase and then stiffened up and would not
turn to
change frequencies. The mic' buttons work ok to change frequencies, but
I am not familiar with the mechanics of the dial. I had taken the front
panel apart once
and saw no problems... put it back together and it worked ..... a while.
Any helps appreciated. email at my call arrr.net or post reply retired
and read lots of newy groups
Thanks 73 WB9SMX

-No idea; but, you can find both the manual and the technical supplement
to it at the following URL:

http://www.mods.dk/view.php?ListManuals=yaesu

A qualified guess - on my club's Omni VI, you adjust thumbwheel friction
by rotating the dial itself while keeping the plastic ring surrounding it
stationary. This may over some time cause the dial to either spin very
loosely or not at all, depending on whether you prefer to tune up or down
the bands. ;)

I use to own a ft757. I think you will find that the brass bushing has
frozen on the tuning shaft. You can take the tuning dial out (somewhat
difficult) and carefuly unfreeze(wd40 etc) then relub. Been there,
done that. Also Yaesu will sell you a new dial if you donot want to
"renew".

VERY functional. Allows one to keep a piece of paper handy to remember the assignments of 500 frequencies. I'd trade every one of them for another 20 dB of TX phase noise reduction.

2508. CS-F500 Software reply

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-27 17:16:48 UTC
From: jhndesi@yahoo.com.au
Message-ID: <1117214207.951239.239480@g47g2000cwa.googlegroups.com>
Source record: 15331

Hello Frank! The cloning application you seek will be on the Icom download page of the hackersrussia site. Youm will need a USER Name and Password to download the File or Files.There are many files on this page so you will be doing a thorough perusal.On the page you will see Software for IC-F510,521,610,621(Password inside)I think the password would be the identification numbers for the installation wizard for the CS-F500 Clone software. As i mentioned you need to give the ICOM page a thorough perusal.There will also be IC-F500 Series software,version 1.0 . There will also be IC-F500Series software,version 2.0.You are probably not aware but you can do direct entry editing of the RX and TX frequencies on the F621.I do not have the F610 or F621 but the info was passed on to me.Anyway I use the F2010. My dealer mode access is the PO and channel up button and then the passcode is entered on my program assign buttons and the channel down button.I am not sure how the Dealer mode procedure is activated on the F621.I would like to hazard a guess that maybe the dealer activation on the F621 is done the same way as the F2010.I would be interested in finding out if the same sequence can be used on the F621.Thanks in advance Frank! because I have a favour to ask of you in return for my software assistance I submitted.This is the sequence I would like you to perform on the F621. STEP 1: Press the PO button and the channel up button both together and then power on. Should something such as DEALER appear on the display you will need to enter the Icom default dealer passcode of 159357. STEP 2. To enter the Dealer mode perform this button sequence : P1 PO Down arrow(DOWN Channel Button) P3 P0 P2. You might see SET MODE in uppercase or capital letters on the display.Press one of the buttons to enter dealer set mode for the IC-F621.Anyway the sequence for 159357 will be = P1 PO Down arrow P3 PO P2.If you have success please submit a posting as to what parameters can be reconfigured in the Dealer Set Mode Region for the F621.Thanks! in advance and anticipation.And now for the ICOM URL: Go to http:\\www.hackersrussia.ru/Radio/m_icom.php OOPS!!! thought i forgot something.You need a Username and Password to download the files.Username = hackersrussia Password = freeFORall. So the username will be in lowercase.The password will have no gaps and the free will be in lowercase with the FOR in uppercase and the all in lowercase = freeFORall.Hope you have enjoyed giving my article a perusal.Sorry if it does not seem very eloquent.

Shelby, NC. In southwest NC, along the border with SC. Check it out on any
roadmap or Mapquest. I forget the date but do a Google search for "Shelby
hamfest".

Get a 12V miniature bulb from Radio Shack. They come with leads already attached and are low current (and low heat). I just used this same bulb in the meter of an Icom IC-740 I bought at Dayton and it works fine....

Hello, JusLookin!
You wrote on Tue, 24 May 2005 10:35:38 -0700:

Shelby, NC Hamfest is always held Labor Day weekend. Located 53 miles
from Charlotte. I normally return on Sunday's to continue the flea
Market if in need of a particular item.
Regards, Jim

2527. Seeking SBE documentation

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-28 20:12:18 UTC
From: k5dh@qsl.net
Message-ID: <U_6dnaytc-E_TQXfRVn-sQ@centurytel.net>
Source record: 15250
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hi all,

I'm looking for the following SBE manuals:

- SB2-VOX plug-in VOX unit
- SB2-XC plug-in calibrator unit

And these articles from CQ magazine:

- How to Improve your SB-34 Transceiver
by Ed Marriner, W6BLZ, CQ 04/67
- CW and Extended Coverage for the SBE-34
by Katashi Nose, KH6IJ, CQ ??/67
- The SB-34 Transceiver Expanded Coverage
and Convenience
by John Schultz, W2EEY/1 CQ 09/68

Yes, I'm aware of the multitude of online vendors
who sell manuals. The going price is $14 to $16.
That seems a bit unreasonable for a 2 to 4 page
photocopy, don't you think? Besides, I doubt that
any of them have permission to sell copies of SBE's
copyrighted manuals!

If you have the information that I seek and you're
willing to copy it for me, or loan it to me so that
I can copy it myself, I'd love to hear from you.

If you feel some need to stroke your ego by flaming
me, go right ahead. Just be aware that doing so
will tell the rest of the world that you're a jackass.

73,
Dean K5DH

2528. FS: SABER, P1225, GP350, MORE

Newsgroup: rec.radio.amateur.equipment

Hi all,

As promised; since no one wants to trade, here are the left over radios for sale/trade again.

VHF Saber II [ready to convert to S-III w/case], DES/XL module, rap-chrgr, batt. $225

VHF P1225, 16ch. DISPLAY, DTMF, etc. charger, batt. $200

UHF GP350, 16ch., GP300 accy adapter, chrgr, batt. $175

Photo of above radios here:

http://www.sleepguides.com/auction/p1225_saber_gp350.jpg

MARATRAC drawer unit only, 100watt, 46-50Mhz? [T81XTA7TA7BK], good condition with
'siren mount holes' courtesy of someone who didn't care. No tray.

800mhz STX radios, 3ea. good, bad, ugly, but working. $30 each, $75 all.

Will program up to 24 channels free.

USHIP, anywhere worldwide. PayPal +2% or Postal MO only.

Check must clear my bank before shipment occurs.

more photos if necessary.... Still up for trading too!

thanks!
Randy

From: Mr Fed UP <mrfedup@bellsouth.net>
Message-ID: <7wlme.29050$8S5.17267@bignews3.bellsouth.net>
Source record: 15254

Well I certainly want to thank you.
I nearly got all the screws back in it now, but turned it on and the dial works now after relub.
Seems like they did build the radio around the dial hi hi.
When I got the face plate off, all the buttons fell out like a box of chicklets.
The shaft was froze so tight it took a couple hours of wd40 and gun oil just to get it
where I could beat the shaft out of the bushing. I would guess that Yaesu would want a
bucket of money for a new optical dial encoder.
I am retired disability now and over the years not much has deterred me from diving into
a good fix it up project. I think I even remember tubes and old teletypes.
;-)
It was a great help knowing it was possible to fix it before diving in. Much
of the stuff
built now days are use and toss away with not much chance of repair,
Thanks again. Gary 73 WB9SMX

2537. ECM Noise on CB

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-29 22:43:19 UTC
From: Zombie <noemail@non.com>
Message-ID: <Hjtme.17$_r1.8053@news20.bellglobal.com>
Source record: 15260

Hey guys I have a problem with alittle noise from the fuel pump and a lot of noise coming from the ECM on my 95 maxima. I hope someone can help me out.

Here is the deal: Uniden CB radio. I have a 3' K-40 mounted in the rear quarter panel. When I switch on the ignition, engine on or not it floods with noise. I turn off the ignition, after 2 second delay the noise stops. If I dont have the antenna connected i get no noise. If the only the positive connecter of the coax is on the radio then i will still get noise. I measured the resistance between the co-ax ground and the radios ground and got 90 ohms, between the radio ground's and the negative terminal of the battery its about 2 or 3 ohms.

The antenna has a solid ground connection to the chassy, and under the hood i have a 4 gauge cable bonding the negative terminal directly to the chassy. This might make it seem like all the noise is coming from the antenna side of things, but if i use my handheld CB on AA battery power there is virtually no noise picked up. If its powered by the cigarrette lighter then noise comes flooding in. This makes it seem like its coming from the power source.

I get zero noise from the AM radio in the kenwood CD player, which is on a noise filter anyways. I tried connecting the CB to the same power source and it didnt help.

Has anyone had a similar problem?

2542. Air band, 2m and marine VHF on the same handheld radio?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-30 03:25:38 UTC
From: Tapio Sokura <oh2kku@iki.fi>
Message-ID: <RNvme.745$a_2.182@reader1.news.jippii.net>
Source record: 15265

I noticed a while back that Yaesu has a model called VXA-700 that combines air band and 2 meters into the same radio. This is an interesting offer, but even more interesting would be to get marine VHF in the same package. Or just marine VHF and air band in the same radio (tx/rx on both bands) as I have my share of amateur radios anyway. Has anyone seen this kind of radios for sale? Are there common legal restrictions that could prevent offering a marine VHF and air band in the same rig?

This might sound like an odd couple, but for me it would fill a nice void; sometimes I need to talk on the air band and sometimes I need marine VHF, but rarely both at the same time. With these combined into one radio I could probably save some money and room compared to two different radios. I guess I could settle for one air band radio and one marine VHF radio if they have compatible batteries, chargers, microphones etc accessories, any "series" radios like this?

Tapio

2543. IC-730 mobile in FORD Powerstroke???HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-30 04:10:16 UTC
From: Steve <hogrider@flash.net>
Message-ID: <429A9228.BF50CB6B@flash.net>
Source record: 15266

Hay all! After having this nice truck for 9 years now,
im finally going hf mobile! Have Icom 730 rig, mounted
in 96 Ford F-350 powerstroke 7.3 Liter ?Diesel truck,
1ST- Mega noise on ignition system! NB doesnt help at
all. No matter what speed you drive it gets worse at
highway speeds, *Antenna here is a Henry Allen TX bug
catcher bumper mounted on left rear side. Homebrew pipe
bumper, solid, and yes its grounded! And its solid
20over S 9 signal generated from that truck engine.
Chokes, coils, torroids help? And yes this is long
bed truck so the antenna is about 17' or so from the front
the motor or engine compartment.

2nd- Biggest problem, is when you key the mic even not
modulating it, just keying it, slows the motor down
like you take your foot of the accellerator and applying the
brakes. This happens regardless what power I have the
icom set at! 50 watts, 30 watts, same thing! ***
I have tapped in the power fuse box thats under the dash,
for direct power to rig, would directly having it go to
the batteries up front help any? Or is this little rf
messing with the computer module under the hood next to the
firewall? Back in January I had the right side power
harness replaced, like the set of sparkplug wires that
go to the individual injectors on the right side of the
motor. Could there be a ground not connected from the
repair shop? Truck has 142K mileage, runs like clock,
but im affraid of the excessive rf power messing with that
computer module?

* Any tips or suggestions, calling the ford dealer in
Austin monday am, not sure if it would help, since most
people dont know what ham radio is anyway!

Thanks for reading, any tips zip them my way

PSE!!!

I believe Ford has certain electrical components that can be replaced
to reduce interference to communications systems -- your dealer should
know what's available for your model and have the tech sheets.

Lotta people in this user group have complained about Ford noise.

Bob, yes Ive been keeping up with this subject for a
while, but i can believe the noise im getting!
It just could be the older rig, Im going to try the
strapping first, dont have any of that stainless braided
stuff, but older rg8 u coax will do the trick i think?

Then going to make a few turns of coax and make a rf choke
to maybe cutdown on rf feedback,
then the torriods are next. What really scares me is
that on 40 the engine is severely effected by just simply
keying the mic. I wonder what other cures are out there!

Bob, you run hf mobile? antenna? any power?

tnx, Steve.....

I have a 1995 Ford Explorer. Using an IC-706MKII and a Webster Bandspanner antenna. I realize your vehicle is diesel and mine is gas, but the solution may be the same. My problem stemmed from the fuel pump. Ford has a retrofit electrical filter for the fuel pump. Noise went from an S-8 to S-0.

RF feedback into the computer is a valid concern. I would recommed a direct connection to the vehicle battery. This is generally the recommended method of connection for high current applications anyway.

What sort of feedline do have you going from the rig to the antenna? I would probably go with RG8X. Have you checked the condition of the UHF connector on your coax where it connects to the rig? Make certain it has GOOD contact with the shield portion. How is the coax terminated at the antenna? Is truck bed solidly bonded to the chassis frame?

You may try re-routing the coax cable to the opposite side of the vehicle.

It is possible a floating ground on the replacement wiring could be causing your trouble. You mentioned "sparkplug" wires...which I doubt you have.

Do these problems show up on ALL HF bands?

Assuming it varies with engine RPM, it is not ignition noise, it is coming from the fuel injectors. See an earlier post re: suppression.

FYI, the antenna has a tunable tip, and i eliminated about 90% of the noise
by retuning the tip. Havent checked the SWR yet though.

Are you going to periodically resurrect my post so you can make yours over
and over again?

I asked my question months ago. You answered it then. Enough, already.

Source record: 15286

I have an ICOM 706 MKIIG mobile radio for sale. The radio is in excellent condition with no marks or scratches. Has never been used mobile. In great operational shape putting out 100 watts on HF and 6 meters; 50 watts out on 2 meters and 20 watts out on 70cm. The deal comes with the radio in original box with manual and remote mounting kit, Heil Traveler headset/mic, Heil HMM hand mic. There are 2 extra narrow filters installed one for CW and one for SSB, FL-100 and FL-223. I am asking $800 and I will pay the shipping to any U.S. address. I can be contacted by email to duane@na3vy.us or reply to this.

2575. Alliance Tenna-Rotor-- How old?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-31 15:11:30 UTC
From: nonsenseword7@hotmail.com
Message-ID: <1117552290.351940.82050@g49g2000cwa.googlegroups.com>
Source record: 15348

Can anyone give me a date or date range for the Alliance Tenna-Rotor, model H.I.R. 2? It says on the underside "Patents Applied For", so I'm thinking it is pretty early. It is a four wire, 115 volts, 60 cycles AC only, 45 watts if any of that info is helpful in dating. I've been unable to find this exact item on the internet with any details.

Thanks in advance.

2577. HTX-100 & HR2510 parts radios in one lot

Newsgroup: rec.radio.amateur.equipment
Date: 2005-05-31 17:14:36 UTC
From: flyboy <wbblair3@yahoo.com>
Message-ID: <1117559675.908045.95950@f14g2000cwb.googlegroups.com>
Source record: 15350

Sold for parts in one lot, a President 10 meter SSB/CW/AM/FM HR2510 transceiver and a Realistic HTX-100 10 meter CW/SSB transceiver (missing top and bottom cover but has mike). The HTX-100 powers up, but the synthesizer section doesn't work. Don't know anything about the HR2510 other than the fact that neither it nor the HTX-100 show any external or internal evidence of overheating due to major faults in the circuitry or applied voltage (i.e. no visible evidence of being catastrophically "smoked" through over-volt or cascade failure). The XMT power transistors on the HR2510 have been unscrewed from their heat sinks by a previous owner or technician unknown.

Make offer via email - wbblair3@yahoo.com

Just wondering how you can possibly 'retune' the antenna without knowing
where the swr is at any given time?

I am assuming the radio is wired directly to the battery with fuses on
both positive and negative? You certainly wouldn't consider running the
radio off of the car's auto electric system, right?

2586. Re: ECM Noise on CB

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-01 02:25:09 UTC
From: Zombie <noemail@non.com>
Message-ID: <a09ne.8842$yG4.634969@news20.bellglobal.com>
Source record: 15363

I haven't retested the SWR yet, mainly because there is some amount of stuff I have to take apart to get to the back of the radio. Then some stupid neighbor comes over "WHOA MAN You got your car all apart!!!" and starts wigging out <sigh>. And yes, I have committed the evil sin of running off the car's power, my Kenwood CD player picks up AM without a hint of noise from the engine, so I always declared it clean enough. However, I know Nissan recommends running straight off battery power. I already recycled some nice 14 gauge wire from work, and have a hole in the fire wall and some fuse holders and a relay all sitting there (so the radio can be shut off with the ACC), waiting to be soldered together. I'll have to try putting those in this weekend. Right now the way it is the noise added is small, and only transmissions I have to strain to hear in the first place are getting drowned out. However, even with reasonably strong reception the annoying part is that it noise mixes in and creates a very annoying tone in the background.

For RF cable I am using mil-spec RG142. The original buyer paid about $200/foot for it, and I acquired it at highly significant discount. Before I just had some Tandy RG-8 stuff in there that I acquired at a ham fest and it worked quite well but i decided i could do better. The Tandy wire I put in originally was about 18f long or so. This is because I believed some tall tale about coax cable length and resonance frequency when I installed it, however I haven't seen anything confirming this theory beyond the CB world so I dumped it and used the shortest length of RG142 possible. After replacing it I measured the SWR and antenna field strength, and even after tweaking the K40 inductor the SWR went up slightly and field strength went down slightly. RG142 with its dual layers of brayed and foil shielding, silver coated center conductor and reduced length should have increased antenna performance, so im not sure why that happened.

I do get some amount of noise from the fuel pump. I put some bypass capacitors and an inductor on the power lines going into it. I also bonded the negative wire straight to the body rather than let it go back to wherever it goes to get grounded, however doing those things only marginally decreased the noise. Before i played around with the antenna tuning, that fuel pump would come on the radio and screech like it was about to be eaten by a hungry bear.

if you goto http://labvolt.com/product.asp?id=163&Line_Id=64 they do have a device there to convert an ordinary scope into a somewhat crude spectrum analyser (i believe it maxes out around 127Mhz), but im not sure if they sell that device seperatly, and the whole Fm/Am training suite which the link goes to is around $250,000 CDN.

Spend some time to think VERY carefully about your requirements.
I have a DSO with an FFT display. I find it interesting on occasion.
But if you need a spectrum analyzer, you need a spectrum analyzer.

The key parameters are resolution bandwidth and dynamic range.
In most cases requring a SA, a toy isn't nearly good enough in those
areas. You can't look at a signal when the thing is overloaded or if
there's another signal too close. Toy spectrum analyzers have very WIDE
bandwidths. If they don't, they're not toys and not cheap either.
A SA with a tracking generator is very useful if you need to design
filters or align repeater cavities.

Remember that the dynamic range of a scope is very low. It's not
shielded. When you try to hook an external box to it, all sorts of
stuff finds its way into the scope. And the scope radiates the signals
you stuff into it. Not good if you're trying to measure something 100dB
down.

Service monitors CAN have very good spectrum analyzers, but the ones you
can afford probably don't and have all the bad characteristics of a toy
spectrum analyzer.

I have a TEK 492 with tracking generator. I use it rarely, but when I need it, I'm glad its there.

It's all in your requirements...no free lunch here.
mike

It is well known that endfed 1/2-wave dipoles and similar length
antennas can be difficult, if not impossible, to tune up using
conventional T-tuners.

Download program TUNEHALF from website below and become familiar with
another tuner circuit which deals with vertical, inverted-L and
sloping antennas.

Check with your Motorola dealer (or wherever you got the radio). What you
want is the CTCSS option for the radio (one is available).

Travis, and Nitespark!

Well the that sounds nice, but dont think its the fuel
pump! Did the ground strapping on monday, my day off
for the holiday, seemed to lower the noise sum, did
make 6 turns of coax (rf choke) at the end of coax before it
goes in to rig, to cut down on transmission of rf chasing
back out!

But the engine still almost dies on 75 meters, not so much
on 40. Never did try 17 meters, bands been so bad of
late i just cant get motivated to do this!
May try this weekend, and you all say would ford dealer
carry this retrofit for noise suppression on their
vehicles? Or could i order via hr on the net? I see
lots of promises but do they really work?

Would some new coax help? some of the double shielded
stuff, RG-8 ???? with a foil wrapped on the outside of
the casing? Or could it just be this older Icom HF rig?

Now i did hear on the the newer 706's series the noise
blanker is better shape than the earlier ones?

keep posted folks, Im gonna get this sooner or later????

Steve.................

That radio already comes with tone squelch. It sounds like you want the
Quick-Call option. Many of the Motorola radios had that in the stock unit
also. If you program it up, check to see if this signaling option is
available "out of the box".

Pete

It's some sort of Optical Encoder. I had the same problem with my
FT-767. It just started acting up one day. When I would turn the VFO
the frequency would only go down not up. Then, it slowly started to lock
up and get harder and harder to turn. Then it totally locked up.
I couldn't even turn the VFO with "Vise-Grips"

I took it in to a local Ham Repair Shop.
The part was only $50 and 2 hours labor. It's a fault with many
Yaesu radios. It only happens to the radios owned by us who like
to "REALLY" spin the VFO every once in a while.

Instead of spinning your wheels, you could just call your Ford dealer
and get the appropos tech sheets and, if needed, parts. Then go from
there. A lot of Ford owners have had noise problems of this sort.

Diamond SRH77CA HT antenna 2 meters and 440 MHz, receive 120, 150, 300, 450, 800 and 900 MHz.

The Diamond SRH77CA is an HT antenna for transmit on 2 meters and 440 MHz. It is a 1/4 wave on 2 meters and a 1/2 wave on 440. It can additionally receive these bands: 120, 150, 300, 450, 800 and 900 MHz. As a result of this exceptional coverage, we actually sell more of these antennas to scanner listeners than hams! It is a favorite model for scanner enthusiasts, and for those using the new breed of wideband handheld radios.

This thin, flexible, black antenna is 16 inches (40 cm) tall. Gain is a 2.15 dBi (440 MHz), provides up to six times the performance of regular antennas. This antenna terminates to a 50 ohm SMA connector.

I bought this for my son and he has not used it and it is in great condition

OK, I was just making some suggestions. A Ford dealer should be able to tell you if there is a retro filter kit for your model vehicle.

If you decide on going with bigger cable and you might want to consider Belden 9913.

I might try a length of RG8X first though. It isn't going to cost that much for a 20ft length.

My guess is, you have RF ingress and egress from the truck computer and unless it is completely shielded with some sort of metal shroud, you will continue to experience problems. Even that may not help, if the spurs from the computer are emitting from the harness and the harness is capturing the nearfield RF from your antenna.

A friend of mine is a comm tech for the local school board. He got a 1995 Ford Explorer as a service vehicle. When he mounted some VHF high band and UHF radios in there for work, he was getting birdies all over the spectrum. He never was able to suppress them, and basically just had to live with them. I also have a 1995 Explorer and just out of curiosity, we checked and our two vehicles were manufactured within 2

weeks of each other. When he took an HT on the same frequencies and held it around the engine compartment of my vehicle, it was perfectly quiet. He had even gotten a new computer to put in it, and that didn't help.

You are correct about the newer 706 models. The IC706 had some serious design flaws in the receiver. The 706MKII and MKIIG corrected those flaws and added UHF in the "G" model.

I don't know that much about the receiver of the IC730.

>considered when aligning the horn to the dish.

Hi Dave,

A horn is an impedance matching device, not a lens. It is generally
pointed in the direction of desired maximum radiation. If you want to
employ what appears to be the equivalent to your application of focus,
then its "throat" is the term you should be interested in (at least
from the common literature on this subject - a subtle hint, in spite
of your protestations, on how to google this).

The plane of the throat is usually placed at the focus of the
truncated parabaloid (otherwise known as the dish) and orthogonal to
the parabaloid's major axis (the line that points in the direction of
the opening's maximum radiation). Hence both are collinear (and of
necessity, the horn blocks some of the available radiation), unless
this is an off-center feed. In such a case, the math becomes a little
more involved (but all structures conform to these usages).

I have the ICOM supply plus two ASTRON switchers running here.
No noise 40M - 70cm.
I don't operate 160 or 80 right now, so cannot comment on those bands.

The cutline under one graph of RF noise read:

"This supply exhibited low levels of broadband noise. The most
prominent peak appears between 4 and 7 Mhz."

And in the conclusion of the text:

"According to ARRL lab tests, it is at least as quiet on the HF bands
as other comparable switching power supplies on the market."

This was a Sept. 2002 review in QST.

JK-

I got the PS-125 with my 756 Pro 2. I also have Radio Shack and MFJ switchers.

When receiving with a magnet-mount antenna mounted a few feet away on the
washing machine, I can pick up a low level noise from the PS-125. The
MFJ, which has a good reputation for low noise, is noticeably worse. The
Radio Shack switcher is a total wipe-out.

I don't recall what band I was receiving. I doubt there would be any
perceptible noise from the PS-125 (or the MFJ) when using an outdoor
antenna.

I believe the OP really IS looking for a 'roger bleep' (made famous by the early NASA transceivers that put a 'bleep' at the end of each transmission so that the receiver would know that it was their time to transmit). It's an option on some radios....but don't know if it is software controlled on his model.

Hi Dave.

W1GHZ has an application that will determine the focus of your dish for you.

However, I find it easier just to attach a few small mirrors on the dish
and point it at the sun to determine the focal point of your dish. See

http://www.qsl.net/va3rr/dualmode/dual_mode.htm

Now you just have to figure out where the phase centre of your feed is...

Just to give everyone an update, i retested the SWR and it was extremely high. So i reset the antenna inductor back to where its supposed to be and the SWR went to 1.5:1. I also ran wires back to the battery, then through a filter and to the radio. After spending 1.5hours getting all that installed, the noise doubled compared to what i had before.

From: Rightrik <gaggiorNOSPAM@tin.it>
Message-ID: <3gfv5qFc2kr4U1@individual.net>
Source record: 15214

Hello,
i am looking to buy an automatic remote antenna tuner to use a long wire random antenna, a good choice should be a Kenwood AT-300 because i'll use this unit with 2 Kenwood HF RTX (100w max out).

It should be well kept, not modified, and (of course) complete and perfectly working.

I am not interested in base or manual models : i'm looking for an automatic remote antenna tuner only.

To write an email: gaggior at tin dot it

Thank you,
73 de Riccardo IK5WQO

I guess I wasn't able to divine your intent, then.

You say you have a surplus DirecTV "feed". You say you know the focal
point of your dish. You want to use your own 2.4 GHz feed. You
make mention of an adjustable feed - is it a chapparel-type feed because
I didn't think the DirecTV feeds are adjustable?

What kind of horn are you planning to use for 2.4 GHz? DirecTV dishes
are usually fairly small - the more efficient feedhorns are fairly
large, at least for 2.4 GHz if you have a .7 f/D DirecTV dish.

The simple answer is to place the phase center of your 2.4 GHz feed at
the focal point of your dish. What is the phase center of your 2.4 GHz
feed? Maybe this is the question you want to ask. If so, the answer is
probably here.

OK. I think I understand. Assuming you are using the DirecTv dish, and
you want to replace the DTV horn with your own horn or dish feed, the
'phase center' of the DTV horn is about .25 lambda from the mouth of the
horn.

So, you place the phase center of your replacement feed at the same
point as the DTV horn's phase center.

Again, assuming you are using the DirecTv dish, neither the cantenna nor a patch antenna will provide ideal illumination for a DTV offset dish, which has an f/D of around .7

If you are OK with linear polarization (is the antenna for WiFi use?), I suspect a biquad would provide better illumination than a cantenna or a patch. Not that the latter two wouldn't work, it's just they aren't optimum for that f/D

Russ

Dave

Do you know of a web site where the offset dish f/D is defined? I am
familiar with the conventional (feed at the center) parabolic reflector f/D.
My question relates to my wondering if the TV satellite dish is a parabola
with the horn feed offset away from the focal point.

**Thanks Vic. Strange though. I went through what was supposed to be
the latest amateur equip sales list of a few sites and the latest is
2002; 3 years old. Thought they would be more current than that unless
Im looking in the wrong area. Appreciate URL.

> Thanks again,

Yes. Just turn the biquad so the one quad is 'on top' of the lower quad
and you will have horizonal polarization. The pattern looks pretty
symmetrical in both the E and H planes

Best of luck

FS Dentron MT-3000A Antenna Tuner, covers 1.8 - 30 MHz. It is built with quality heavy duty parts and will handle up to 3000 watts P.E.P. It has a built in coaxial switch, dummy load and balun. It works with a multitude of antenna systems, including up to 3 coaxial lines, long wire system, and a balanced feed line. It also has built-in separate meters for monitoring SWR and power. most sought after This antenna tuner is in excellent condition. There are a few nicks and scuffs on the cabinet. The front panel is almost perfect. There is one scratch on the aluminum insert of the transmitter matching knob on the left. Price is $295 Plus shipping. Thanks, Charlie Hugg, K5MBX

2658. FS Lots of Ham Gear

I have the following ham gear for sale:

Ten-Tec Model 261 Power Supply, $115
Ten-Tec Model 705 desk mic, $65
Icom IC-280 Mobile 2 mt Transceiver, works, manual, box, cable, mount,No tone, $55
TPL 2mt Amplifier 10watts in. 70 out, for FM and SSB, $55
Yaesu FT-747 Mobile Mount and manual, $30
Drake 1525EM Mobile Mic with TT Pad, $30.

All prices do not include shipping costs. Please e-mail me for details on condition.
Thanks, Charlie Hugg, K5MBX

2659. FS AMCOMM HB-125 QRP HF Amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-06 02:59:33 UTC
From: Charlie Hugg <hug-a-bug1@cox.net>
Message-ID: <h_Ooe.25784$DC2.10757@okepread01>
Source record: 15232

FS a brand new AMCOMM Penetrator Amateur Linear HF QRP Amplifier Model HB-125. I bought it from the original owner who never took it out of the box. I fired it up for the first time, and it works very well. It is a true Amateur QRP HF amplifier that covers 40 through 10 meters and has band switches and low pass filtering for each band. It is type F series certified by the FCC. It is strictly a QRP amplifier in that 5 watts AM or CW or 12 watts SSB is all the input that it is designed to handle. Output is up to 180 watts, depending on band. This is a very well constructed and designed amplifier. AMCOMM is still in business, but they do not make the amplifier any longer. It comes with the original instructions, schematic, warranty card and the original box and packing. I don't believe there is a finer QRP amplifier on the market today. This one is mint. Price is $275 shipped in lower 48. Thanks, Charlie Hugg, K5MBX

Is the PCS4000 anything like the PCS3000???? If so I would be
interested in getting it just for the Mike/and coil cord and plug
Look at the mike plug and see if it has 16 receptacles on the
end of the coil cord. Also please email me direct to
jfenn@lava.net and will make you and offer.

2666. MFJ 249B/259B vs. Autek VA1

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-06 16:32:28 UTC
From: Joshua G Senecal <senecal@ucdavis.edu>
Message-ID: <Pine.LNX.4.61.0506060922430.4657@pc33.cs.ucdavis.edu>
Source record: 15239

Hi All,

It looks like I'm going to be in the apartment for another year, so I need to build a better limited-space antenna (probably a helically wound dipole). I'm considering obtaining an antenna analyzer to assist me in this.

Being a grad student I don't have a large budget, so (unless I suddenly come by a lot of money) I'll probably have to get something like the MFJ 259B or the Autek VA1.

I've looked up the specs on each, and read the eHam reviews. It seems that generally both work well, but both companies have quality control issues, with the MFJ quality being slightly better but the Autek providing more features. I'm attracted to the Autek because of its price, but I don't relish the idea of having to open the thing up and resolder a bunch of connections.

What are *your* opinions?

Thanks!

-Josh, AE6IQ

Yes. There is a 'pad' location for one. And, an 'attacment' point after
the mike pre-amp. But, it would need to be a single freq. selection.
There'd be no auto-channel-by-channel selection. I dropped a Com-Spec in
mine _and_ added a wee little thumb-wheel switch to select the tone needed.
Tedious work - that! HI!HI!

Long time ago, tho'. Two things came to pass at nearly the same time.
The processor in it went kah-kah, and I finally forswore to never again
operate 2M FM. My dead, 'tricked-up' PCS-4000 now sleeps with the used
kitty litter.

Jerry-

I understand there is a class of unsymmetric antenna where the feed is
actually at the focal point, but the reflecting surface is only a side
section of the whole parabola. Although it is physically "offset", it
functions as a parabolic antenna.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Pioneer Scsii
CD changer. No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

You might mention this is an older edition. Also, while I'd be the first to admit that Joe Carr probably knows a lot more about RF Design than I do, it's much more of a "cookbook" than a book with any significant theoretical basis (such as Hayward's, Orr's or DeMaw's books have); the title is -- IMO -- a little misleading.

Hi Greg, I have a 746 with ATU at home and a 706 NO ATU in built in the car
you would find these good radios for the Foundation level as you can run
theses radio`s at 10w no prob`s, I have spoken to a lots of people on 10w on
80m and with good signal reports,not sure on your price range? Also make up
a G5RV very easy done and great for all freq, let me know if you want the
wire lengths and I will send them 2 you
Good luck on your exam

I have for sale a Yaesu FT-7 HF Transceiver. It looks good, some wear and scratches, and the receiver works. All dial light work. But no output in transmit. Probably needs finals. Final transistors should not be too expensive. This is the 20 watts out version. It comes with the Yaesu hand mic and a W7FG Manual.
Price is $95 plus shipping. Thanks, Charlie Hugg, K5MBX

That's one of the nicer pre-digital audio filters that I've had the opportunity to use. The new owner should get a lot of use out of it. BTW, there was a very positive review in one of the Fine Tuning Proceedings.

it is productive to spam rrae and keep doing it.

2689. Icom 751 Problem -- Help Please

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-08 06:08:57 UTC
From: Rick Frazier <rickf@rickfrazier.com>
Message-ID: <42A68B6B.3F69B0F5@rickfrazier.com>
Source record: 15162

Ok, Here's a new one for me, but perhaps one of you has solved it already.

One of my Icom 751 transceivers is acting odd... The T/S button and DFS button seem to do the correct thing, but I can't switch bands. Pressing the band switch in causes the frequency to display at a much higher rate than normal. (with the Band button in, the frequency changes so rapidly that it appears to be about 1000 times faster than with it off.) The frequency display moves through a given band, then goes to the bottom of the band and repeats... You can't get the radio to move out of whatever band it started in. At first, I thought the band button was broken, before I realized that pressing it in causes the display to change MUCH faster than when it is not depressed.

Also, pressing the RIT button or the XIT button causes the RIT or XIT to flash momentarily on the display (as I press the button in, it happens about half way down on the button press) but RIT or XIT is not engaged...

The Ham/Gene switch also seems to have no effect. The radio display just will not go beyond the band I happen to get when I turn on the radio.

I pulled the standard Icom ram board and put a PIEXX ramboard replacement in, (from a 751A that works just fine) and it doesn't change the symptom, only the frequency range happens on another band.

OK, so have any of you radio gurus out there heard of this problem, or encountered it and know of a fix?

I've googled for 751 mods, repairs, problems and spent hours trying to find anything this way, and all I can seem to find are a few mods (some of which seem to indicate that failing electrolytic caps can cause a few other symptoms, but nobody has mentioned anything that sounds like my problem...)

Thanks

Chapter 6-2 shows the phase center of the NBS dual-dipole feed to be .25 wavelength behind the dipoles, and around the same for a quadloop feed.

I suspect the phase center for the biquad is something similar.

MOTOROLA BASIC SERVICE MANUALS AND NOTES:
CD-ROM WITH SERVICE MANUALS, USER MANUALS, SOFTWARE USER MANUALS AND OTHER GRAPHS/CHARTS AS LISTED.

Description
This CD contains the manuals and notes in adobe .pdf file format. The radio basic service manuals are professional format files and comprise the majority of this CD. The manuals for R2001, KVL and Systems Saber are amateur representations but very nicely done and perfectly useable. You'll find no trash or unreadable pages on this CD, and I will guarantee your satisfaction or simply return the CD for a refund [minus $5 shipping and fees], it's that simple. I will email an example of the professional pages if you require it, but I assure you professional means exactly that. "Factory" may be a better word to use.

Includes: BASIC SERVICE AND ALIGNMENT MANUALS FOR: ASTRO DIGITAL SABER, GM300 MOBILES, GTX/LCS2000 MOBILES, HT750, HT1250, HT1550, HT/LS versions, MTX850, MTX950, MTX8250/9250, MTX/LS, HT1000, JT1000, MT2000, MTS2000, MTX, XTS3000, XTS3500, Waris series, Jedi Series, MTSX series, R2001A SERVICE MONITOR svc manual with R2001D user manual, MISC INFO AND PAGES FOR: WARIS Series C.P.S. manual, ASTRO C.P.S. Manual, HT1000/JT1000/VISAR R.S.S. manual, MTX series C.P.S. manual, HT1250 User manual, HT1550 User manual, and more. Model Number breakdown pages, Antenna Identification and Color charts, R2001D User manual, MOTOROLA MICOM X and MICOM 2 info and RS232 files, PRO radio accessory part number sheet, Systems Saber III User manual, CDM series model number breakdowns, T3011DX Key Variable Loader (KVL) User manual, Alert Monitor Tuning procedure, and more.

****** COMPLETE CD-ROM ONLY ******
PRICED AT $38 shipped in the USA, plus shipping outside the USA. thanks,
Woody

Hello. I currently use a WSP255RS RCA 900Mhz transmitter

http://tinyurl.com/a6y5e

to send MP3s to a Sony Spiar Receiver.

http://tinyurl.com/8ayyg

The range of the RCA is 300'. I would like to know
if there is an easy way to slightly increase the range of transmission.

Is there a 900Mhz antenna amp or kit available to maximize range?

Would desoldering the flimpsy antenna and putting a thicker/longer
antenna increase range?

How about making a better antenna? Something like
http://www.shed.com/tutor/mr26ant.html.

Any ideas would be appreciated.

Hi,

Yes, cute.

>to send MP3s to a Sony Spiar Receiver.
>http://tinyurl.com/8ayyg

Yes, that's cute too.

>The range of the RCA is 300'.

Rather pretty good if you already get this (instead of simply being an
advertising claim).

>I would like to know
>if there is an easy way to slightly increase the range of transmission.

Hmmm, yes. But there are reasons not to. "Slightly" falls slightly
outside of good specification. Please state specifically what you
need.

>Is there a 900Mhz antenna amp or kit available to maximize range?

Undoubtedly, just like the availability of porn, you can buy almost
anything. Is it commercial and could you get it at Circuit City or
Radio Shack? - afraid not. It has to do with that law thingy, and the
FCC (black market answers most of this).

>Would desoldering the flimpsy antenna and putting a thicker/longer
>antenna increase range?

Depends on antenna design, which could mean thicker/longer wire, but
thicker/longer wire is not the answer - it depends on antenna design
(probably why you came here).

>How about making a better antenna? Something like
>http://www.shed.com/tutor/mr26ant.html.

Where the other posts were cute, this is gross. Now, that is not to
mean like vulgar - simply too, too big.

Look at the antennas in the first two links, and compare to this last
one. Even if you made it the right size (and it is in fact the wrong

size); then it wouldn't really bring anything to the table. It does answer the agenda of antenna design, but it is not an example of what you describe wanting.

A simple solution for "slightly" more range is to build two corner reflectors (google search keywords) at each end. Tin foil on cardboard conception models can answer many questions. Toss in an additional keyword, 900MHz, and you will probably find enough to work with.

Perhaps something like this little antenna:
http://www.ramseyelectronics.com/cgi-bin/commerce.exe?preadd=action&key=LPY915

Plenty of "illicit/illegal" stuff is available,ya just gotta know where
to look,and of course,many times it also depends on how you use such items.
Adding an antenna will probably violate part-15,but I doubt you'll get
any "heat" from doing it.

Perhaps you mean "the quoted range is 300'". This will an absolute maximum in an open field, /not/ through the walls of a house.

> I would like to know
> if there is an easy way to slightly increase the range of transmission.
>
> Is there a 900MHz antenna amp or kit available to maximize range?

Forget amplifying it. The cheap (and pretty nasty) transmitter circuitry won't provide a /clean/ enough signal for amplification, and 900 MHz electronics isn't trivial - layout is /really/ crucial.

> Would desoldering the flimsy antenna and putting a thicker/longer
> antenna increase range?

Possibly. Try it and see.

> How about making a better antenna?

Possibly. Do a Google search for a suitable 900 MHz home brew antenna - perhaps a corner reflector type.

> Something like
> http://www.shed.com/tutor/mr26ant.html.

Definitely not. That's truly hideous, on the wrong frequency, and probably doesn't work at all - he'd be better off with a random length of wire! The "FM balun" he suggests would be seriously lossy at 900 MHz, and the dimensions are wrong.

Bob

Hi OM,

OK, another cute link. However, $30 and postage/handling does nothing
to add signal that wasn't already available from the existing design.
On the other hand, if you or your folks found comfort, years back, in
buying a pet rock, this could be your antenna.

2713. Identify High Current Power Supply Transformer

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-10 13:45:10 UTC
From: pinpassion <mjdrum@comcast.net>
Message-ID: <1118411110.631833.320870@o13g2000cwo.googlegroups.com>
Source record: 15186

Hi Gang,

I have a large and heavy power supply transformer
that is part of a high current power supply project
that was featured in 73 magazine back in 1973. It
was started by a ham radio operator and was never
finished. I am going to finish it, if I can. I am
trying to identify the transformer leads. This is
for a 12 volt, 40 to 60 amp output. Here are the markings:

This transformer was made by ADC and is marked 541-010 REV H.
There is a marking on it that says 3-19470 and what I think
is a date code of 7438. There are terminal connections on one
side that are numbered 1 - 6. On the other side the connections
are numbered 7 - 14. I need to know the connection scheme for
this transformer so I can put it to use. I contacted who I
thought was the manufacturer "ADC" for information, and that
did not help.

I don't have the issue of 73 magazine, and I don't even know
if this is the same transformer that may have been part of the
construction article. I can take pictures and post them if that
might help.

Anybody have any ideas?

Thanks a lot.

Mike

Do you REALLY need to use this heavy piece of tower for this project? I can't help you with any suggestions here, but would like to ask, Wouldn't a nice roof-mount tripod base work better? Seems to me the necessary beefing up of your roof trusses would be more work than most hams would care to do, even for a short 8 foot top section. At least maybe attempt to trade down to a Rohn 25 piece.

Source record: 15196

Hi, everyone-

I don't know if this is the right group for my question, but I can't find any other groups to ask.

I've been trying to do research online to find the best pair of GMRS radios for vacation/travel use. I'm building the $80 FCC license fee into my figures, and have about $160-170 to spend, so the pair of radios should cost no more than $80-90.

I've seen 2 Motorola models that look good... the T5950, and the T7400R. The 5950 has been out for quite a while, and several users have given it good reviews. The T7400R has virtually NO reviews, though it seems to have been out for several months.

So why would I be interested in the 7400? It's 2 Watts, and claims a greater range (7 miles) than the 5950. But I've only been able to find three reviews for it. One says it's the best thing since sliced bread, and two others (which were written last year) just say it's not available yet.

Does anybody have any experience with these radios, or feel that another model is the best out there in the $80-90 range (per pair)?

It's been very frustrating trying to find any information or reviews on these things. Usually I enjoy doing web research on tech products before buying, but this search has been very tedious. Thanks for any help you can provide!

-Mark

Not that I would ever advocate ignorning the law, but I understand that the majority of GMRS users don't bother to get the required FCC license.

You should consider MURS radios as well. Some advantages of MURS are 1) no license required, 2) you can use external antennas for greater range, 3) no repeaters permitted in MURS spectrum so less chance of interference from that source, 4) less popular, so less interference from other users.

Go for a five channel, 2-watt, 38 CTCSS tone radio. I prefer radios that can take rechargeable AA NiMh cells...you get good battery life and the cost of replacement batteries is very reasonable.

http://wireless.fcc.gov/services/personal/murs/

There are a limited number of suppliers of MURS radios, so I can't help you with product selection. Here's one that seems to be popular.

Wow, thanks everyone!

I just took a look at the MURS radio, and my only concern would be whether it's compatible with FRS/GMRS units. My family is taking a trip to the beach in August, and 2 cars have FRS/GMRS radios... and we need to talk to them.

Thank you, Dick, for the link to Popular Wireless' GMRS forum! I've been to his site in my search, but had missed the GMRS Forums entirely. Signing up now!

-Mark

Nope, they are not compatible, so I guess that idea is out.

Quite true.

While there are disadvantages to the FRS/GMRS radios, one big plus is
how many other people already have them.

Yep, I've even thought about exending the TX/RX coverage on one of my synthesized UHF HT's to cover FRS/GMRS bands. Might come in handy one day.

I've recently bought a Citroen AX (1.0 petrol - 1993) and think the radio has been wired up incorrectly - the radio goes off when the headlights are turned on!

The radio manual is here (page 27):
http://kenwood.nl.nt.ims.hr/languages/EN/support/manuals/KRC-479R~379R%20(EN).pdf

The speakers are all connected up fine, but I'm not too sure what to connect the battery (yellow) and ignition (red) to. There are three wires available, a grey, a grey with red markings at the end, and a white.

The two grey's are attached to another connector - the same size as connector A on page 29 of the manual - but is not actually connected to the radio.

Hope someone can help.

Thanks,
Phil

Ed's question about beefing-up your roof is a good one!

Assuming it won't be overloaded, why not get one of the Radio Shack tripod
mounts for each leg?

However you do it, it appears some roofing expertise is needed to prevent
leaks. Perhaps a commercial roofer would have some better ideas about
mounting your 45G.

A completely legal alternative is with a ham HT, with extended RX and
a scanning function, is to include the FRS/GMRS frequencies (with any
CTCSS code on receive being used) and have a separate GMRS rig with
you, but turned off.

The FRS/GMRS band is far enough from the 440 band that an antenna
optimized for one may have a bit of SWR on the other.

For some public service events, we have considered a two level
network, with hams doing the more than a mile comms, and non-hams with
FRS doing the close range, relaying through the hams as needed.

You can call the professional roofer BEFORE you install, or the first
time it rains AFTER you install.

You decide which costs less. ;-)

While I would much prefer GMRS over FRS because of the power
capability, if you only want coverage between cars while traveling
together, FRS works just fine for that purpose. Of course ham radio
is even better, but then you have another set of hurdles.

I'd like to know why the wire colors you have differ from what the
manual says you should have, before offering suggestions.

That is exactly the scheme that we use in Washington County
(Suburban Portland, OR) with the ARES/RACES and the CERT teams.
(ARES and RACES are co-contiguous here, not separate groups.)

ARES = Ameater Radio Emergency Service - area-wide and long-haul
inter- and intra-agency communications only. Control remains with
amateur group leadership acting within Memoranda of Understanding.

CERT = Civilian Emergency Response Team - first aid, traffic and
access control, light rescue, and victim assistance responsibilities
supported by on-scene communications. CERT teams are sponsored
directly and controlled by local emergency management officials. A
number of CERT members have gone on to study and qualify for amateur
radio licenses.

RACES = Radio Amateur Civil Emergency Service - communications under
control of emergency management officials used to supplement or
replace their communications facilities, used after declaration of
civil emergency by competent authorities.

Not sure what you are suggesting here. Why leave the GMRS radio off?
It is certainly legal to use a ham HT to listen to anything but cel
conversations, but very illegal for use to transmit on GMRS
frequencies.

The poster I was replying to mentioned modding the ham radio to TX on
FRS/GMRS, as well as RX. If extralegal suggestions are made, those
getting them should be fully aware of that fact.

OK. I understand if you are wanting to scan other frequencies as well
as FRS/GMRS. Then turn on the GMRS if you need to transmit. That
would make sense.

>>It is certainly legal to use a ham HT to listen to anything but cel

I saw someone post possibly modifying his UHF HT to cover FRS/GMRS. I
couldn't tell if he was talking about a ham HT or something else.
Many people aren't aware that it is legal to use a GMRS radio (for
transmit) on ham frequencies, but it is not legal to use a ham radio
on GMRS/FRS frequencies. GMRS/FRS has technical requirements that
most ham radio equipment does not meet. They also have to be
certified. Just wanted to clarify that.

Dick

But if you modded the radio to cover 70cm, wouldn't you then be unable
to use it for the licenced FRS bands?

The wires coming out of the radio are all correct. It's the wires coming from the dashboard (the two greys and a white) which I'm unsure need connecting to the radio.

Thanks,
Phil

That would be my understanding.

The certification of the equipment would lapse if it is modified
physically, and it could no longer be used on any service other than
amateur bands.

Programming amateur frequencies into a commercial radio would be fine,
if properly licensed for all of the frequencies.

Right. Normally, modification is not necessary. You just program in
the new frequencies. A point of clarification. The FRS is not a
licensed service. It does, however, require certified equipment.

I have a Vertex Standard VXA-210 Pilot w/SU-1 sensor for sale. It is in very
good condition with very little use. The battery is in great shape
and the radio is ready to be put into service. This is a NAV/COM radio.
I have pics available if for those that are interested.
$225.00 plus shipping Cont. US only.

Includes the following:

Ni-Cad Battery Pack FNB-64 (7.2V 700 mAh)
Overnight Charger NC-77B/C
Helical Antenna ATV-7
Headset Cable Adapter CT-60
Operating Manual
Belt Clip

Also included is the SU-1** Barometric Pressure Sensor. ($40.00 option)

General Specifications
VXA-210

Number of Channels
150 Channels

Frequency Range TX Com:
118.000 - 136.975 MHz
Frequency Range RX NAV:
108.000 - 117.975 MHz
Frequency Range RX Com:
118.000 - 136.975 MHz
Frequency Range WX:
(WX-01 - WX-10) : USA version only
Channel Spacing 25 KHz
Emission Type TX: AM
Emission Type RX: AM & FM
Power Supply Voltage
6.0 - 15.0 VDC
Current Consumption (approx.) 65 mA (squelch on)
190 mA (receive)
1 A (transmit 1.5 W Carrier)

Ambient Temperature Range +14° F to + 140° F (-10° C to + 60° C)

RF Input-Output Impedance 50 Ohms

Dimensions (WxHxD): 2.3" x 4.3" x 1.18" w/FNB-64 (58 x 109 x 30 mm)

Weight (approx.) 12 oz (340 g) with FNB-64, antenna, and belt clip

Receiver Specifications Measurements made per EIA standard TIA/EIA-603

Circuit Type Double Conversion Super-heterodyne

IFs 35.4 MHz and 450 KHz

Sensitivity < 0.8 u V (for 6 dB S/N with 1 kHz, 30 % modulation)
Selectivity < 8 kHz/-6 dB

Adjacent Channel Selectivity < 25 kHz/-60 dB

Audio Output 400 m W @ 8 Ohms, 10 % THD

Transmitter Specifications Measurement made per EIA standard TIA/EIA-603

Power Output (@7.2 V): 5.0 W PEP / 1.5 W (Carrier Power)

Frequency Stability Better than ±10 ppm (+14 °F to +140 °F)

Modulation System Low Level Amplitude Modulation

Spurious Emission > 60 dB below carrier

Int. Microphone Type Condenser

Ext. Mic Impedance 150 Ohms

Well, since according to your first post the radio works when the
headlights are off, I'll assume that the battery lead and the ground
connection are correct, but that the "switched A+" connection is hooked
up to the wrong place in the car. If it were mine, I'd trace that wire
back, or simply not use it and connect the radio's switched power
connection to a point in the car of my own determination. If you are
unable to use a volt meter to find a good switched connection alternative
for your radio, I can only recommend you seek a professional radio
installer for that info.

PS: or as an alternative, you can simply hook up the radio switched
connection to the battery hot lead and just remember to turn you radio
off manually every time you leave the car!

Good luck.

Ed

Hmmm, lets see. You spam newsgroups with "coming soon" auctions, then
with current auctions and then with "one day more" notices.
Why don't you make a list for maybe one month and just post it once?
Some of us get really pissed off about the constant reminders to "come
look at my stuff".
Just when did you decide that public discussion groups were your
personal corkboard for selling?

I'm not carping about posting ebay links - I'm carping about the manner
in which you're doing it as if I need 3 whacks across the head to look
at your stuff. Once is enough.

2778. Drake R-4B receiver alignment question.

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-13 15:10:58 UTC
From: cnoneicnjfsssss@hotmail.com
Message-ID: <42ada1be.3178470@127.0.0.1>
Source record: 15001

I was aligning a Drake R-4B receiver. When aligning the receiver sensitivity and the S meter the manual states to set the RF gain to read -15 volts from TP2 (test point 2). The manual states to set the meter to S40. At -15 volts the highest I can get my meter to go is S20. I replaced every tube in the receiver except the first RF amp, and the only reason I did not replace that tube is because I don't have one of those tubes at this time.
The alignment instructions for this section are on-line at;

http://www.wb4hfn.com/DrakeManuals/R4B/Manual_R4B_38.jpg

The full Drake R-4b manual with schematic is on-line at;

http://www.wb4hfn.com/DrakeManuals/R4B/Manual_R4B.htm

Any ideas why the S meter will not go to S40?

Hi Phil
The best way is always to connect directly to the battery. The only way
that you can connect it switchable is using a relay connected directly
to the battery and switched on when the engine is running That's how
most of the high current devices already work on your car, the fuel
pump, the headlights, air conditioning, heater fan, horn and more.
Good luck.

First check R9 and R13 both 1.5K make sure they haven't changed
Go back and touch up T6 and T7
Then check if the sens control R40 reads 1K across
That should correct your full scale if your 1rst RF tube is OK.

You might, when you consider what he went through in that trial. Paying off someone doesn't necessarily mean you are guilty. Pay offs happen all the time.

Personally, after hearing all the wierd witness testimony and the lying that went on, I still don't know whether to think he was guilty or not. On the other hand, I am certain he is one sick wacko with his head all screwed up.

2790. Things to put in "remarks" section of flight plan

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-14 01:03:32 UTC
From: "C. J. Clegg" <answer.to.newsgroup@nospam.com>
Message-ID: <j0bsa1d9qmp8nm30dugmqs10dtsd2p4jg8@4ax.com>
Source record: 15015

When filing a flight plan (VFR or IFR), and you are carrying some non-aviation-type backup means of communications such as an FRS/GMRS radio or an amateur VHF radio, is it worth it to put in the "Remarks" something like "Amateur 146.52 MHz, GMRS Channel 1"?

I'm sure that if you go down, the CAP or whoever comes looking for your sorry butt would be interested in knowing if they should try to call you on something other than 121.5.

Any thoughts?

Bi-linear= amplified transmit and receive. IIRC, those receive amps were
about 20dB gain and noisy as hell.

73 all,

I have started a new hobby, eventhough I have 3 digital scanners,
1 pro 2006, a BC 300 and a BC 210XL, all mint, I have decided
to start collected old vintage Bearcat crystal scanners, particularly
the BC 12 is what I really want but any VHF-HI/UHF scanner other
than the BC 3 will do.

If anyone knows where I can get my hands on one or two plus
a source for crystals, let me know will you.

Best 73 to all,

Patrick

If this was a transceiver, I would agree with you. For an ordinary
"car radio", connect it up to the accessory fuse (if there isn't a
separate radio fuse which most passenger vehicles have nowadays) and
be done with it.

If it's a Citroen, all bets are off.... <ggg>

You know... not just Lin-yer, but TWICE as Lin-yer... da
dubble-whammy-mammy-jammy-for-the-astute-hammy.

Either that or it is such a complicated abstract of the parallel linearity
of circuitry that a sane mind couldn't possibly comprehend it.

Last I learnt, them lin-yers was a dollar a watt, [being bird-watts of
course], so if that thing is a killer-watt, then it's half-price!
But don't laugh....
Right now somebody out there in skip-land is trying like heck to sell some
rottweilers and gold-triggers in order to buy that thing.

Maybe he'll think twice now, of sleeping in bed with young boys.
Unfortunately, zebras rarely change their stripes. He was "lucky".
He claimed to be innocent the first time too, so how come he paid off? If I had all that money - I'll be damned if I'd pay off if I was innocent.

I once had a liking for MJ, but when I heard he paid off.... well.....
that told me a lot. Had I not heard that, I'd have been in his corner til proven guilty. Knowing he paid off, put me on the fence of the unknown - able to fall to which ever side produced the strongest case - without hesitation.

Oh believe me, I heard some of the bull shit lies told in the process. Those would have swung my thinking in his favor 100% had it not been for the previous pay off. I heard what you said and you may be right, but I still can't help to think that paying off - is the wrong answer - IF one is innocent. It still gives the image of guilt - as it clearly has not only in my opinion but many others in this case. That is a shame, he had a very promising carerr, was good at what he did and now his name forever tarnished - regardless. Maybe he didn't do it and/or didn't mean harm to kids, we won't ever know, but his antics sure were a bit hard to follow. I'm not God, I don't know if he is guilty or not. IF he isn't then I sure in hell am sorry to see he had to get dragged through that hell and I wouldn't wish that on any "innocent" person. But, if he did even 1/3 of what was claimed, then he certainly needs help. Even having been found innocent, he may want to consider seeking counseling. It may save him from a future case.

Hello,

I have a Kenwood TS790A with a few problems :

TX and RX are dead on 2 mtrs and 70 cm. Sometimes the radio becomes alive
and is works normal.
When i power on the radio the freq is displayed and after a few seconds the
display shows only dots.
The 790 has not the 23 cm option.
Do someone has a solution for this problem ?

If it will help clear the air a tad.... one of the jurors said he believed MJ has molested boys, but in "this" case, the one being tried, there was enough evidence to let him go - according to the charges they had to deal with. Doesn't matter.... he is still being painted a molester. HE IS DONE. His life is finished regardless what he does. The media - right or wrong, is eating that stuff up. "THEY" don't let anything go. He is fried regardless how he was found.

Did you set the zero adjust to S1 with the antenna
disconnected first? In reality, on many bands there
may be anywhere from s1-s9 noise level with the
antenna connected. It is probably set too low.

Actually you need to go back and forth between the two
adjustments, and there will be some warm-up drift.

Nice radio!

Yagi antennas for frequencies this high are ridiculously compact and easy to build! A full wave is only in the 33 CM area, so a "long" Yagi with 6 or 7 elements would look like a yardstick with 5 inch wires bristling from it. If you only need to send signal in a particular direction, this is the way to go-and reduces the chance of unwanted "listeners" in another direction.

If you need omnidirectional gain, stacked turnstiles floor to ceiling , looking like a pole lamp brisling with 5" crosses, would do it, yielding maybe 9dB or so of gain by flattening out the pattern. Multiple half waves in phase (vertical with 1/2 wave phaseing sections) will do it with vertical polarization. In stacking anything, you get about 3dB gain for each doubling of the number of elements.

Shit, hams on 1215 MHZ and 1KW amps are communicating by bouncing signals off the MOON, with antennas yielding 30dB plus gain being reasonable in size due to short UHF wavelengths.

Message-ID: <d8p86mdvn1@ss405.t-com.hr>
Source record: 15055

I want to work QRP 5W output on my FT-857.
SWR is close to 1:1.
If I set power to 5 on FT-857 (in menu I can choose from 5 to 100) my
Pyramid SWR14 shows RF output 1W.
If I set power to 15, Pyramid SWR14 shows 4W.
Can I trust to Pyramid SWR14?
I don't want to work QRO and to give other HAMs /QRP.
Can someone who owns FT-857 and accurate RF power meter test the output. If
I select 5 is it 5W or 1W?
Thanks in advance for reply.

2835. Intrusion system, *Easy* & *Cheap-to-build* plans, need

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-15 18:40:59 UTC
From: casteele95thbgheavy@yahoo.com
Message-ID: <1118860859.830351.32850@o13g2000cwo.googlegroups.com>
Source record: 15058

I need to find an easy, cheap-to-construct outside intrusion system (several detectors/monitors outside that will set off some kind of an alarm inside a motor home a hundred to a few hundred feet away). Unless anyone here can offer a better suggestion, I'm looking for really easy to use/understand schematics or plans so I can build the system myself.

"Easy" to build, defined: During the war for the freedom of the Republic of South Viet Nam, I was an electronic tech in the army, but have forgotten most all that, and my only recent such experience was building a VERY (!!) simple 12 vdc ultrasonic generator on a breadboard.

"Cheap to construct" defined: I've been out of work for a year while recovering from a black widow spider bite, my last job won't take me back, and the only income I have is unemployment and $$ from stuff that I inherited that I'm selling.

"The Idea," explained: Due to the above bite, I had to give up my apartment, lived in a friends camper for a year, and then somebody just recently "gave" me a 24-ft. motor home which I am currently trying to make drivable and livable but for which I cannot afford to pay for a space in an RV park.

So, I thought I might offer to park the RV on sites (construction, church, whatever) and offer night security monitoring via the use of intrusion detectors placed by me around whatever site the MH is on, the thought being that they could set off an alarm in the MH that would wake me up [unless I can make a business out of this, I still need to job hunt during the day] and I could then take whatever steps would be appropriate ... like shining a big ole' spot light in the direction of the detector that was set off or, better yet, calling the police :)

Any ideas, suggestions, or links that might help would really be appreciated.

Christopher A. Steele
San Diego, CA.

Hi all,
I have this variable power transformer that I need to replace the main power switch on. I'm not sure where I could get one or exactly what type of switch I need. I was told the company that makes this transformer unit is in China and I would be better off finding a generic replacement from the USA. I took a photo of it and printed the specs (to the best of my limited ability) on it. Could someone please take a look and point me in the right direction to a website link where I can order one and let me know what exactly do I ask for? Thanks much in advance! If you have any trouble with the picture link below, please e-mail me (Elzo_Jenkins@hotmail.com) and I can attach a jpeg in my reply.
Regards,
Elzo Jenkins

Check Radio Shack - they have very similar switches. Also, check the local auto supplies store such as Advance, Pep Boys, etc.

2849. FS: Icom IC AT-500

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-16 12:38:43 UTC
From: Steve <sahd@hotmail.com>
Message-ID: <7f6dnde6kf9O7yzfRVn-3Q@comcast.com>
Source record: 15072

I have a Icom AT-500 automatic antenna tuner, will automatically switch bands
with your Icom radio. Will also work on other brands of HF gear but not automatically
switching bands.
This tuner has a problem like maybe a cold solder joint.
It was from an estate sale. I have no use for it other wise I'd
send it back to Icom to get repaired.

It will switch bands along with Icom equipment and tune but when you
push on parts inside the case the rec signal changes.

It's in good shape with a couple of scratches on top case.
Face is in good condition.
Any one out there interested?
Make an offer.

Thanks

Steve

My financial situation precludes a pet, even if "part" of a new and
thus 'unsure' business/money making venture: I'd feel pretty bad if I
took on a "pet" and it needed a vet and I was unable to care for it.
I'm trying to meet my *present* financial obligations, not assume new
ones I may not be able to meet.

Note that the NTE switch uses an separate LED for power indication. You
may want to also look at Alcoswitch's PRG series.

Newark Electronics, Digikey, Mouser, etc. All have websites.

Probably needs to be a higher rated switch, as a transformer may pull
a lot of current. Be generous with the specs.

Check e-bay for "microwave intrusion alarm", "microwave motion sensor", doppler microwave" etc. There are some cheap surplus units which can be activate a relay upon a vehicle or person approaching. Be prepared for false alarms unless you set up properly.

2864. RFI on HF rig help!

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-18 00:15:57 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <6JJse.15621$6o4.10423@fed1read04>
Source record: 15087

I know, I know - "RFI *on* an HF rig" & not "RFI *from* an HF rig"?

Thats it. In trying to match the capabilities of a friend's HF performance (rx only), I built what seemed to be a better radio (K2). His rig is no lamer, either - its a Yaesu FT-920. I can now equal him on signals heard. We live close enough and have similar antennas so according to the numbers, I should be able to copy signals he has trouble copying more often than not.

Still, I rarely hear better than him. We are usually just equal. According to the specs, I should hear a bit better and I'm not.

I went over to his place and listened - his noise floor was lower by 2 S units. He dosen't own a computer and I do so I figured it was my PC. Came home and shut it down with maybe 1/2 a S unit drop in my noise floor. Even un-plugged the power strip going to the PC.

Then it came to me - I live closer to the city and am on a hill while he lives in a depression. He had noticed another ham who has much more trouble hearing and we both realised that the other ham lives much closer to downtown than we do.

Could my noise floor problem be due to the fact that I have a line of sight path to downtown 3 miles away? My friend is 2 miles out farther and like I said, in a depression that puts him 50 feet below downtown's grade. I'm 50' above downtown.

What can I do to lower the RFI from downtown? I've fought intermod before but on VHF/UHF and that was a long time ago.

I have very little experience with RFI from a city on HF .

Moving is out.

Help? Ideas? I'm not looking for much - I figure if I lower my noise floor 3 db I will have gotten 98% of the noise. I have a RX only port on the K2 and have a 10m inverted V hooked up there but that just kills the whole spectrum except 10m.

BTW the main band of concern here is 40m. Maybe I could build a BPF? Anyone know where I could find plans for one?

Source record: 15088

Hi Ken,

The excess noise from the environment should override any internal noise generated by any of the current amateur rigs. If there would be any advantage, it would be when listening to weak signals that are very close to strong signals.
Generally, you probably wouldn't see any difference. Now, about those S-Meter readings on noise level.....the most likely reason for the difference is probably S-Meter calibration.
To verify this, you would need to have a signal generator with an accurately calibrated output attenuator. With this piece of equipment, you can inject a 50uV signal into the antenna input. Typically, S9 equals 50uV at 14MHz.
It is hard to tell if this is the reason or if you really do live in a noisier area.
As far as specs, just about every rig I have tested has an MDS in the 0.1uV region. When receiver specs are given, there are at least two methods that can be used. One of them is the soft measurement technique, whereby the output of the signal generator is directly connected to the antenna input, while the hard measurement technique has a 50 ohm thru-load connected between the signal generator and the receiver that is being tested.
The soft measurement technique yields better sensitivity figures, and that is what most of the manufacturers use.
I hope this helps.

Pete

well,
there are a couple of small problems:

1. you don't have enough drive on the output of your transmitter and
2. the listed amp was not designed for 88-108 Mhz in any case

one additional point, that transmitter uses a heavily coupled antenna
connection, which would pretty much preclude hooking to any external device
without buffering circuits (this starts to get complex and costly real
fast).

better off just getting a better part 15 device or running dedicated speaker
leads to a multimedia distribution box in the house.

This reminds me of the Yugo I saw last year parked at the hamfest. It had 16 antennas attached in various ways, had the passenger seat removed so he could stack his radios, and had a huge hole in the side for the coax., neatly plugged by the way with clear caulking. Classy.

Assuming your house is constructed of steel i-beams, just weld the base of the tower into the steel roof truss and you should be good to go. If you have a traditionally constructed home of wood, brick, and plaster, then just go ahead and file a claim with your homeowners insurance, indicating the cause as owner stupidity. It will save time on the claim when the tower crashes through your bedroom ceiling at 3 am and pins you under the ceiling fan.

What you failed to mention here is what you plan on doing with them.
There isn't much more than a nickel's worth of difference between a
cheap FRS radio and a good GMRS radio in your price range. You might get
better communications across a large lake but that would be about it.

wouould it "know" the difference between noise and signal?
As for noise floor- take Pete's suggestion or take your K2 to your friends
house and compare signals there.

It is likely the noise comes from your house- switching power supplies in
consumer electronics, fan speed controls, dimmers, microwave ovens etc.

Put the K2 on battery power and turn offf the main breaker into the house.

I once mounted a section of Rohn 25G on my roof. The house was two-story with a one-story garage. I built a platform out of 2X pressure treated lumber and sat the platfrom straddling the ridgeline of the garage. Inside the garage I spanned several rafters with 2X and ran long bolts through the platform, through the roof, and through the spans thereby securing the platform to the garage roof. I drilled holes in the platform to match the 25G legs and fastened the 25G section to the platform with U-bolts. I then installed a Rohn house bracket on the side of the two-story portion of the house and clamped the tower section into the house bracket. I put a 10-foot piece of high tensile mast in the tower and mounted a 24-element 432 Yagi, small tri-bander, and 5-element vertical beam for 2 FM.

The guy who made the initial post also needs to know that there are roof-mounted towers. They consist of spread tripod legs; mount with bolts going through the roof, lumber in the roof spanning several rafters/trusses, and gobs of roofing tar.

Check out these roof-mounted towers:
http://www.glenmartin.com/industrial/pg17.htm

I did that today - WOW! What a difference! Unplugging my PC and
turning off the SEC 1223 ps (leaving the K2 on SLA cells automatically)
made a HUGE difference! The PC was causing 90% of the noise.

My noise floor went from S7 to S4 and new stations just jumped
out of the air.

My friend still hears less band noise than me but only by 1-1.5db at
the most now.

Now, how do I solve the PC noise problem? I guess I could spend
a small fortune in ferrite snap on chokes but I doubt I would be able
to equal how quiet it is with the PC off. If that's so, I doubt I'll bother
- it's just too easy to turn off the PC during net time......

Would a laptop on batteries work without noise?

To cut down on PC noise, use a metal case with no plastic inserts.
Use ferrite beads/chokes on all cables coming out of case, and if
possible, put a metal plate between PC and radios, I have a metal layer
under my desktop/workbench that is grounded, with the radios above, and
Pc's below, with a LCD monitor connected to each pc through a KVM
switch, with very little if no noise from pc!!!

If you have any fluorescent lights in the house, turn them off. Take a
small radio on AM and walk around to find the source.
Much of your noise is probably the PS of the PC. I use to get that when
I used the regular $20 PS's Go to Comp USA and get a good high end
supply, the cabling is shielded and they are designed for low RFI. The
cost is a bit higher, $150-500 but it's worth it if you have computers
near radios. I have 4 computers running in the radio room on 4 UPS's
NO NOISE to the radios at all.
Good Luck!

2878. Emergency Radio: Marine, Aviation, Ham

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-18 22:31:43 UTC
From: Tom <nospam@nospam.com>

Howdy:

I'm looking for an emergency radio to cover the marine, aviation and 2 meter ham bands. The Yaesu VXA-700 looks good as it covers the ham and aviation bands but I have found no conversion for transmitting on the marine band---just receive only.

Anyone know of any handheld tranceiver that has the capability of transmitting and receiving on the three bands modified or otherwise?

OK... OK... yes I know... legal issues... I've been a ham for 40 years, flying for 30 and sailing aboard ship as a Radio Officer for 20. I'm just looking for one unit for emergency communications instead of two or three separate units and associated accessories; batteries, charger...

Best regards

Most VHF radios on the market that can receive
things can transmit on those same frequencies, the
problem is not the marine band, that can be done
easily, although not legal or fcc/coast guard type
accepted, although the problem comes in with the
aircraft band, that is AM and these rigs don't have
AM tranmit modules.

Being a Ham for that length of time, I would imagine
you knew that though, just get two rigs, an HT for
aircraft transmit and an IC 2100H will do the rest

Nothing special. (You can use an octal tube socket for
the same purpose, cheaper!)

I have some weird double FT-243 crystals though.
Made for Uncle Sam, they house two crystals in one unit,
either a dual channel job, or one for the transmitter and
one for the receiver on the same channel.

Yaesu have a new HT that covers Aircraft in AM (TX and RX) and 2m FM, TX and RX, and without knowing more about it, just might open up to Marine FM. It was announced as being designed for Flying Hams.

The only bands you do not need type accepted/certificated equipment on
are the amateur bands that you are licensed for.

Any modification of a radio in another service will void the type
acceptance.

Actually, commercial broadcasters can modify their equipment, but also
need to monitor their output for any potential problems.

As for the GMRS license, the manufacturers of the radios do inform
buyers that they need an FCC license, but I have never seen printing
that small before. ;-)

2888. Does anyone know the current value of a FTV-650B 6m transverter?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-19 16:08:24 UTC
From: ke5ckr@gmail.com
Message-ID: <1119197304.085796.226460@f14g2000cwb.googlegroups.com>
Source record: 14961

Hi all,

I've been shopping around for something to get on 6m before summer is over. I recently found a FTV-650B 6m transverter that would go with my FT101B outfit on ebay:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4671&item=5781809383&rd=1

I bid $100 and was planning to maybe go to $150. I was looking good on the auction until last night. I checked in this morning and the bidding has reached $255. This seems a little steep since I bought a my FT101B station complete with the VFO and phone patch/speaker, mic, extra final tubes, etc., for about $350. Does anyone here know how much these transverters are worth? I've looked all over the web and can't seem to get any idea. Any input is much appreciated.

Cheers!

- Matt

2889. Need Schmatics / datasheets

Source record: 14962

Hi

I've got 3 hot hamfest finds so far this season and need documentation on each of them. If you have leads on datasheets or schematics I'd appreciate hearing from you.

Here are the items:

1. A homebrew 420-450 MHz 20 watt amplifier that uses a a Motorola "SHW158 612". A datasheet on the Motorola RF Module would help me get it going (or at least tesed). The amp is missing 1 component (probably a pot used to bias it).

2. A Heath HA-201A 2 meter fm amplifier. A schematic would allow me to figure out how to re-bias this amp for linear service. Please note that this is quite different from the HA-201 (without the "A" suffix) for which there IS documentation at the BAMA site.

3. A Heath IB-1102 nixie based frequency counter. It's currently in working condition but it triggers poorly at high frequencies. A schematic / manual would allwo me to re-adjust it / modify it for more reiable opearation at > 100 MHz.

The commercial sources for documentation on the 2 Heath items are asking very high (way more than the cost of the items themselves) prices for the paper work.

Thanks in advance for any leads.

73,
Lenny W2BVH

Wow,

I love being mistaken when I learn something new from it.

I will have to got to the yaesu website and check it out, I must
have 3 separate TX units on it, two phase modulation and one AM.

Thanks for the post

Are your absolutely positively sure about that.

I am not trying to be cantankerous here, but I don't think there
is specific type acceptance of GMRS or MURS band radios.

In fact you can buy a RS radio and have it programmed for FRS,
or GMRS is you have the Ticket and they will jack up the power,
the rig can also be programmed for business radio. I have a GMRS
rig made by Motorola right in front of me, I am licensed and use it
on a licensed GMRS repeater.... it has no FCC type acceptance on
it at all.

I could be wrong, but I don't find it in the regs anywhere

If it was designed and tested by the manufacturer, for that band, and
you are licensed, it is fine.

Reprogramming or opening up MARS/CAP is not the same as modifying the
radio from its original certificated design.

For emergency communications it doesn't matter.
http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=47&PART=97&SECTION=403&TYPE=TEXT

Sec. 97.403 Safety of life and protection of property.

No provision of these rules prevents the use by an amateur station
of any means of radiocommunication at its disposal to provide essential
communication needs in connection with the immediate safety of human
life and immediate protection of property when normal communication
systems are not available.

As there were not that many made, I would say they are worth whatever
someone is willing to pay. Just like a collector item. I decided to trade
off my six meter stuff for a low band rig that had 6 meters and 100 watts
output for the reason that I could have six meters and use it as a backup
rig for the other lowband rig.

I guess that you never worked on any '60s Japanese 12 to 20
transistor, transistor radios where the entire schematic was the size of
a postage stamp. You needed a microscope to read them, if they weren't
damaged. they didn't want you to see that only seven or eight
transistors were needed, and the rest had all the leads soldered
together to raise the parts count.

Motorola parts starting with "S" are proprietary marked for the OEM.
Look at MHW in similar packages to figure out which part they renumbered
for their customer. Here is a page with some basic Motorola hybrid specs
to get you started. http://www.rfparts.com/module.html

I have a schematic on the IB-1101 Nixie counter which might help.
Heath reused a lot of their designs, so the input might be close enough
to help.

well not to be a spoilsport Gary, but you are wrong in your assertation
above. Any modification of the operating perameters that requires
opening up the case of a Type Accepted Radio, would void the Type
Acceptance of that unit. How do I know this, you may wonder? Well, up
untill the Clinton/gore bloodLetting of the FCC, I was a Field Agent
and enforced these specific Federal Regulations.

Bruce in alaska who once did this for a living......

Thanks Geoff. Yes, the VX-5R, with it's amazing frequency coverage, looks like an excellent candidate for an emergency radio: however, after looking at the conversions for extended transmit it is unclear if it will operate in AM mode for the aviation band. Furthermore, I found a bit of discussion that the cpu chip on the newer units are now programmed for band coverages and simply removing the solder bridges won't 'open' it up.

Your selection did get me looking a bit closer at the Yaesu handhelds. I noticed that the VX-7R had AM mode and besides that it covered 70 cm through 6 m! I found conversion notes for extended transmit that includes the aviation band and it does appear it will operate in AM mode in that band.

Oddly, I noted that the VX-7R is identical in appearance to the VXA-700 nav/com handheld. Besides the aviation band the unit also includes the 2 meter ham band which leads me to suspect it can be converted to the marine band when it is 'opened' up. I don't think it can transmit on the 243.000 MHz military emergency channel---would be nice. I suspect the VXA-700 costs a bit more than the VX-7R and would also offer a VOR receiver for navigation. Probably the best option is the VXA-7R 'opened' up.

Thank you for your reply.

Best regards

Hi Tom,

So I guess it is ok to violate the laws that we
agreed to follow when we signed our fcc apps.

Yes, for emergency use. But why put your life in the
hands of a modified radio ?

If you can afford to use the boat, plane and ham gear,
please consider getting the correct radios.

Your life may depend on it.

Leroy

Hi Michael,

I posted a reply earlier today, but it seems that it never hit the news server. I aplogize if it now ends up on this thread twice!

Thanks for your reply. I was able to get info on the RF Module by starting at the site you suggested and digging deeper into the net from there. A very similar module is the Motorola MHW-720-1. From that data sheet I find that the missing part(s) on my amplifier board are used to key the first stage of the amplifier during transmit. I'll now be able to test it out without ruining it.

I'd be pleased to reimburse you for the cost of copying and mailing the documentation of the Heath IB-1101. If you're willing to do it please email me: lennyw <at> comcast <dot> net. Maybe the 1101 and 1102 are similar enough that the schematic will help.

If any other members of the newsgroup have info on the Heath IB-1102 frequency counter or the Heath HA-201A 2 meter fm amplifier, I'd appreciate hearing from you.

Thanks again.

73,
Lenny W2BVH

Yeah $255 is a bit of a crazy price for one of those.
I guess some guys must be desperate for one.

You can get a better idea of real current value by looking here:

http://www.aade.com/hampedia/yaesup.htm
AND
http://www.af4k.com/ham/boneyard2004.htm

Bear in mind that eBay prices often get bid up to about 200% to 400%
of what most of us think is "reasonable!"

Lenny-

Many yers ago I had a couple of the HA-201s. They had a chronic problem
of self-oscillation, which I eventually managed to tame. I did not
remember that there was an HA-201A version, but it stands to reason.

I have a couple more of the HA-201s that I picked up at a Hamfest, but
haven't had a chance to do anything with them. I would be interested if
you find any information about the difference. As I recall, my "fix" to
the older version involved adding multiple filter capacitors across the DC
power input. Perhaps there is a better way.

From: Joseph Fenn <jfenn@lava.net>
Message-ID: <Pine.BSI.4.61.0506201935430.8961@malasada.lava.net>
Source record: 14982

anyone out there got a manual for the Azden PCS4000. I got most of
the keys figured out, but cant figure out how to keep the stored
chnls that I write. If I turn off the 12VDc I always loose whatever
is stored. I am assumming that the rig was modified somehow as it
needs a minimal dc current to keep the memory inside when its
turned off with the power switch. Also theres no jack or anything
externally that would accept that retention input current.

No, it needs a good internal battery to hold the memory.

Sorry, Joe. I moved to a new QTH just last week, and my dead
PCS-4000 (bad microprocessor) and it's manual and schematics now
sleep with the used kitty litter. I held on to it for several
years -- hoping someone here would make just such an inquiry.
If it wasn't for bad luck, some of us wouldn't have any luck at all.
HI!HI!

Jonsey,
Tnx for the hopeless info. Manual gone with the kitty litter!!!!
this used one I got works okay, its just that I was'nt sure how to
store the freqs in the various channels. BTW I switched it on this
morning and wow there was the last chnl I installed stareing me in
the face, so the internal battery must be of a rechargeable kind.
I had it on all day yesterday so I guess the internal battery took
a charge okay overnight. And the freq I restored with its -600
offset came up just fine. I'll continue playing with it and maybe
get some more fqcys installed. One question. Do you remember if
odd splits can be stored?? I/E afmaRS has a 143.450 output fqcy
and a 142.150 xmit freq (odd split) does the pcs4000 accept that
kind of an ofset or is it limited to the normal +/- 600 or
simplex mode???
Joe/KH6JF

P.S. My email address is good if you wish to email me direct
about this. jfenn@lava.net

I have for sale a couple of 2 Meter Mobile Transceivers cheap. One is an Icom IC-280 Mobile 2 meter, 10 watt Transceiver. It works well, comes with the manual, box, cable, mount. Price is $35 plus shipping. The other one is a very nice Midland 2 meter 25 watt transceiver. It comes with a mic and manual and power cable. It works great and looks almost new. However, the meter does not work. It does not move either on receiver or transmit.But this does not effect the operation of the radio. Price is $45 plus shipping. Neather radio has a Tone Board. Thanks, Charlie Hugg, K5MBX

2930. FA:Mcurdo Silver 5C,Extremely rare.later today

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-22 14:01:19 UTC
From: Heytubeguy <heytubeguy@worldnet.att.net>
Message-ID: <Paeue.1005915$w62.631269@bgtnsc05-news.ops.worldnet.att.net>
Source record: 14904
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

1932/33 McMurdo Silver 5C to be listed later (~9-9:30 PM CDT) today:
Extremely RARE and in working condition, a very nice McMurdo Silver 5C,
Super het of 1932/33 that was featured at the Science Exhibit at Chicago
Worlds Fair. BE ADVISED: if you are looking for a receiver that out performs
the likes of R-2000, HQ-180, etc, pse do not bid-have a nice day. This radio
is for the serious collector that appreciates such a exceptionally rare
antique. I copied SSB on 20 m and 70m this AM BUT I had only an attic
antenna so signals were not as strong as they should be. Covers 1.7-4, 5-12,
& 9-22 mhz. Mid-band is the 'hottest and 10 Mhz WWV is basically right on. I
received noise on 1.7-4 (ant?) but it is receiving a 4 Mhz sig generator
output quite well. Sensitivity drops on the higher band but receives AM
broadcast stations in the 18-9 Mhz region. Unpacked weight is 28 lbs and ~
34 lbs with the 11" speaker! I highly recommend professional packing, but I
will ship in a very large box for protection. FULL INSURANCE IS REQUIRED--NO
EXCEPTIONS. This unit is NOT MINT (which means NEW to me) and if I were to
keep it I would continue to make a few more corrections. It IS very clean.
All tubes check way beyond minimum. All shields in place though may not be
original. Front is crisp and clearly printed (repainted?). SPEAKER INCLUDED;
no cabinet however.Sounds great.
From: heytubeguy on ebay.

2931. FT: R-390-A for Icom 706

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-22 16:30:25 UTC
From: BillMe <billme@handy.net>
Message-ID: <1119457825.98109b745e133c902f155ccf77f6e90b@teranews>
Source record: 14905

I have a recently restored R-390A that I would like to trade for an Icom 706 (don't need a PS). The 390 is missing the ID tag but is assumed to be Stewart Warner as that is the manufacturer of the tuning unit. It has all filters installed and working, it has been aligned and exceeds original specs, PTO tracking is good, caps have been replaced. The front panel was stripped and repainted the original color (light green). It is an engraved panel and all lettering was filled in. The tube shields (black with inserts) are there and both covers as well. Both correct meters are there. Looks and plays great. Located near Philadelphia.

Any takers? Please respond direct.

Ya, but.... Don't rxpect it to necessarily _hold_ a charge --
for very long. If you don't know the provenance of the battery,
just replace it.

> One question. Do you remember if odd splits can be stored??

Nope. Dunno.
I had no need to ever attempt that. So, I never tried it.

It's been 7 or more years since I last 'played' with it. It
died on me just about the time I swore of ever wasting my time
with 2M FM again.

I hope you get it all squared away, Joe.

Jonesy
well I have figured out just about everything without a manual after
all. I still dont know how to setup an odd rptr split (if its even
possible or not). I can do so with the old PCS3000 I had. I am happy
with what I have been able to do like storeing the fqcys, and so far
they are holding up nicely with power off, so alls well that ends
```

well.

Mogoo Mobile Search Service Launched -- www.mogoo.biz ---2024598735 ---
MSN: mogoo_inc@hotmail.com
Search with text message on your mobile phone, anytime, anywhere! It's
FREE*!
Mogoo Services
+ Price search (comparison shopping)
+ Coupon & Rebates
+ News
+ Weather
+ Real-time Stock Quotes
+ Local Business Directory
+ Driving Directions
+ Traffic Info
+ Movies Times
+ Flight Updates
+ White Pages
+ Music,MP3 & Ringtones
+ E-mail Notifications
Wish to make a comparison shopping? Like to get the show time for
movies playing near you? Want a driving directions to show you where
you want to go and tells you what you'll find when you get there? Need
to find the number of your favorite delivery place?
All these seem not to be easily satisfied. But now with the emergence
of Mogoo, everything is easy! Just with your mobile phone, Mogoo will
solve all your problems after pressing few phone-keys.
What is Mogoo
Mogoo is a mobile search service that gives your cell phone the power
to get other instant mobile information wherever you are and whatever
you want.
Who can use it
Any cell phone capable of text messaging can use Mogoo services to
quickly access the information. Best of all, it's free and no
registration is required.
How to use it
Use Mogoo services according to the following steps:
(1) Enter your query as a text message (tips for how to query
specific areas can be found on the "Query specific areas")
(2) Send the message to the short code number: 2024598735
(3) Get your instant information back within 10 seconds.
Tip: For ease of use, store the number 2024598735 as a contact in your
cell phone address book.

>

I banished my desktop 3 rooms away and still had to do ferrite
tricks to quiet the monitor. I am using a laptop in the radio room
and find no noise. Laptops that use fluorescent backlighting
for the LCD may cause problems, but I haven't seen any noise
with my old Tosh t2100. I am also using an Astron linear power
supply for the entire station.

Being on a hill is nice for VHF/UHF, but there is no advantage
for HF operation due to the added exposure to line noise and
various other man-made distractions.

Not exactly.

On HF, it is fairly unusual that you can hear both sides of a conversation, unlike VHF where if I can hear one station, I can usually hear the other. So when I want to call someone, I listen first. Hearing nothing, I send QRL? (or on phone, "is this frequency in use"). If the station I can't hear gets my QRL, he sends C and I go off looking for another frequency.

Very few, if any, digis actually listen first. Even if they did, they don't have a way to say "Is this frequency in use" and understand the response. And even if they could, they really don't have the opportunity to change frequency, since they need to call on the frequency that the remote robot is listening. It seems as if it would be very difficult to make these automated stations be friendly to other users.

That being said, it looks as if Winlink 2000 is going to be come a significant part of our emergency response, which is one of the reasons we have access to these frequencies to begin with. We should be looking at reasonable solutions, perhaps developing new technologies to enable this sort of capability, rather than just flaming.

Both the pro and con in this argument are absolutely unwilling to listen to/believe the other side. We amateurs need to get our act together and figure out how we can expand the use of a technology like Winlink 2000 without making these automated systems even more of a nuisance than they already are.

..

There's plenty of space. We just don't manage it worth a darn.
If you listen to the ham bands, you'll find that the
vast majority of our allocation is wasted. For instance:
you could put every CW QSO during Sweepstakes into about 75 KC of
spectrum and have lots of elbow room.
For phone, probably 100-125 KCs would be a big plenty.
People want their freqs to end in "5" or "0" and that
is just poor spectrum management. Look at ten and six
meters, even at the peak of the sunspot cycle;
90% of it is empty, wasted space.
Every major city has 100+ repeater pairs allocated,
twenty or thirty repeaters on the air and maybe *three*
that get any sustained use.
That's pitiful and a matter of *ego,* not communication.
75 meters is "crowded" only because of our 5-n-10 KC mindset.
Our problem is ego and "we've always done it this way,"
not a lack of spectrum.

We're going to either make room for new and enhanced
modes or we're going to be swept aside like blacksmiths
and locomotive boiler makers, guys.
The times is passin' us by....

Well.... first things first, of course.. why are we always posting such discussion in all these groups for commerce?

Second, and I quote.... "Whatchu talkin' 'bout Willis?"
> If the station I can't hear gets my QRL, he sends C and I go off looking
> for another frequency.
<sorry to whoever posted that. :-) >

I would normally bypass these things but I've been thinking about getting another HF rig lately....and I've been considering why I keep selling them off, trying to warrant a purchase again. I'm thinking it has to do with the words "purpose" and "use".

So, I'm looking at getting back into it and doing something besides setting up a radio and just randomly playing with it or gluing the vfo on some nonsense gathering place.

So here are my questions and observations for your perusal and general flaming.

From the original link posted:

That the HISTORICALLY HIGH LEVEL OF INTERFERENCE BY PACTOR STATIONS to everyone else has demonstrated time and time again that even the operator-controlled Winlink Pactor stations don't care if a frequency is busy (because they can easily take it away), in their passion to get their email from the Internet, so they MUST NOT BE ALLOWED to mix with hams trying to COMMUNICATE WITH EACH OTHER!

Q: Someone please take a minute and point out a single coherent thought or plausible point in the above statement. Bearing in mind that tuning to any random freq can find people squawking over each other like the noise in a crowded room, or a CW freq sounding like my kid running down the "try me" aisle in the toy dept... When did it become impossible for my station to hear 2 other stations that can't hear each other?

Next, from the original link posted.

That ham radio is a HOBBY, not a quasi-commercial email "service" as Winlink provides, and that ham radio, from the very beginning, has always been mainly about hams communicating with other hams, and not about being used for unattended email gateways to the Internet, mostly for a few sailors, because the FCC Maritime Radio Frequencies were set aside for that purpose and are underused.

Observation: If it serves a legitimate purpose and assists a single sailor, military or civilian, it serves a greater purpose than your latest blathering, contest, or quasi-award. The author can 'pucker up and plant one' on that statement. Again, if it is a ham station to ham station, WHERE is the plausible point?? ..... I think I hear a tiny voice yelling "ME, ME, ME... I shall rule the world!"

Also from the original like posted:

That all unattended wideband digital operations, of any type, MUST be confined to the current sub-bands for automatically controlled digital stations, and not allowed to use any frequency they wish just in order to avoid having to wait a short time for a clear frequency in the sub-bands.

Observation: I think SHOULD is a better word. Also take the entire point and reverse it, maybe they feel the same way in a crowded band. Why can't YOU wait a short time for a clear frequency?? [I shall rule the world!!] Also, if you [and Winlink, and Amateur radio in general] wake up and smell the ALE, then you again have a moot point.
If you've ever been on a radio, you realize that attended or unattended matters not; due to world dominators. The problem you're having is with courtesy, not digital ops. Good luck freeing the world of jerks and morons. [and from experience, a dense population infiltration such as the one in ham radio would be a good place to point yer scattergun when you start.]
There's lots of people with lots of free time to build up their personal anger levels for whatever reason, then look for a [safe] place to vent frustrations.
It's the same with the www.
Also, if you paid any attention to Riley at any point, you'd know that he already said APCO25 is fair game on the phone bands, so you are actually showing up on Saturday for the Friday night fights. Sorry you missed us, but thanks for coming out.

And again from the link.....

To stop this attempted takeover, *[I WILL START MY OWN]*
EVERYONE ELSE needs to vote NOT to agree to the Winlink request, so ARRL does not get the wrong impression that the "majority" of hams want to sacrifice the frequencies they use for communicating, so that the less-than-1%, that are Winlink users, don't have to wait longer than 90 seconds to receive an email on HF or can't send picture attachments to the Internet.

Q: STILL trying to understand why he keeps saying "stop hams from communicating so that hams can communicate!" and "I'm not gonna wait 90 seconds on a bunch just because they can't wait 90 seconds!"
You know what... I think Winlink has something wrong....maybe... there're WITCHES!! Everyone chant and point at Winlink... "witch, witch, witch...."
Come to think of it... that pesky ECHOLINK is still going on too! Where's my echolink pitch-fork? C'mon, let's get 'em! Bunch of internet-connected morons sucking up my drivel time... LET'S GET ON THE INTERNET AND COMPLAIN, ESPECIALLY IN ALL THE PLACES WE SHOULDN'T BE! Hahahaha.... this is too funny.

[NOTE: If the author wants real results, he should get on Winlink and email his concerns to the Winlink users... that will complete his hypocritical circle and restore balance to the universe.]
Also,
IF THEY CONSIST OF LESS THAN 1%, HOW THE HECK ARE THEY IN YOUR WAY, BUBBA??
All you want is to have your 100%, right? Why can't people just understand that? It's a mad, mad, mad, world...

Researching the author, I see he is a QRP fan.... leaving me to wonder.... WHY would he want to purposefully limit himself to barely enough power to communicate when he has available a perfectly good 50-100w radio market?? That will give him plenty of power to be heard and not too much to drown anyone out.
I'm betting he operates QRP wherever he wishes, forcing others to WAIT while the do-good folks "give in" feeling sorry and letting the little guy have the time/freq.... what a power rush that must be.
Then again, it could be that he's simply experimenting and enjoying the hobby in the fashion he CHOSE by right, etc....
Nah, couldn't be that.

Before anyone jumps on that, be advised that I've already experienced the common orations on the post-nuclear advantages of QRP training. Here's a news-flash boys... after the smoke clears, your QRP station will either be lost in the new and improved noise floor, or be one of the new big-guns on the suddenly quiet bands.... so I still miss the point. But do I make a hole for you when I hear you? Yes, I do. [Refer to that courtesy thing mentioned above.]

Also, if anyone wonders/cares, I have few "friends" on the local repeater too, since I only use it for communicating when a telephone isn't suitable, or whatever the rules suggest.
Curse me for using simplex instead of the repeater most of the time! See, I had this stupid idea, that the repeater is only useful to me when the communication requirements exceed simplex range. I must be a fool.
It seems that contacting my wife on the repeater [preceeded by paging tones to my alert monitor...OMG!!!] then making my contact, passing necessary info and clearing the frequency is just absurd to the local jaw-breakers who inevitably pounce on any break in the silence, almost demanding attention. How rude I am for not sitting in my hot car in a parking lot for an extra 15 minutes every time I need to tell someone something simple and move on.

Don't get me wrong, I love to chat, ragchewing on a repeater [or HF] is no problem to me, but not every time I key a mic for goodness sakes! But, I digress...

I had a bumper sticker one time.... "I love Jesus, it's his groupies I can't stand.", and I wish I could find an analogous "I love radio, it's the operators I can't stand."

So, with my failure to "get it" along with my apparent stupidity, I now relinquish the floor to whomever.

Radio Specialty Model 1179-22-1 Repeater $ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed,
but inside is very clean!
NO documentation or info...

Standard C468A LNIB $ 90

Standard C568A 95%+ with extended range mod,
and extra hi gain whip. $175

LinkXcel PS-141B 4 port KVM Switch with 4 cables $ 65
-Like New- This is the PS2/VGA model -No manual-

I have several Scsii hard drives, and a Pioneer Scsii
CD changer. No documentation.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Including a SX64 portable that is fixable.
Assorted peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
A lot of cartridges, and software - games to productivity.
Included are extra books for programming ect.
Plus software to run a BBS from the C64..

I would like to sell it all as one group. Will cost more,
if sold piecemeal....

$100 takes it all on the C64 equipment.

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

Does anyone know what the transmitter deviation should be for accessing repeaters with 12.5 kHz channel spacing. I've got a feeling that it should be +/- 3 kHz instead of the +/- 4.5 kHz used for 25 kHz spacing.

You're close. It should actually be +/- 2.5kHz.

Keep the peace(es).

I am looking at purchasing two handheld radios for use in the bush i.e. hunting, fishing, and ATV exploring.

I have tried FRS and CB but I understand that VHF is the best, better than UHF, How about the HAM bands, or the GMRS (UHF so probably not as good as VHF. I have considered the VHF Marine radios which are cheaper than other VHF radios..

Any comments or recomendations would be appreciated.

VHF Marine radios can't be used for non-marine applications.

Are you and the people with whom you're going to be communicating all licensed amateur radio operators? If so, then VHF handhelds with external antennas are probably your best choice for range. They are of course considerably more expensive than FRS or GMRS radios.

If you aren't licensed then MURS radios are probably the best compromise of price, durability, and range. You'll need an FCC license for these, but no test is required.

Some of the entry-level 5-watt 2-meter handhelds can be had for $100
(street price) here in the U.S. e.g. the Icom T2H. That's probably
comparable to good-quality GMRS radios of similar power (not the
cheapie low-power FRS-plus-GMRS radios being hawked all over the
place), and probably cheaper than MURS radios.

>If you aren't licensed then MURS radios are probably the best compromise

Here in the U.S., MURS has been a no-license-required service since
2002 (at least). The radios do need to be certificated for MURS use.

As I recall, the last memories in the A and B banks can be used for odd splits. You program the RX side in the A bank and the TX side in the channel in the same position on the B bank and then put the offset switch in the AxB position. This is a little hazy, but used two PCS-4000's for years on a 4.25MHz split when I was in CAP. 73,

Hey Kevin, thats exactly the info I needed I do believe.
Am saving your msg to my bfr so can print it out. Thats great!!!
for afmars they have a 142.150 (up) and 143.450 (down) so the
split is odd, but your info can do the trick will check it out.
army mars of which I have been a part of since aars days
has the usual simple 148.625 (-600) split so simple to setup.
Did you know that AARS was formed about 1929 by a Signal Corps captain
so as to utilize the "free" benefits of ham radio. All cw
however until end of 1996

2983. Icom F4s flashing display

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-27 09:58:06 UTC
From: eug k <wired_au@change-this-to-ho.tmail.com>
Message-ID: <d9oije$2ajv$1@bunyip2.cc.uq.edu.au>
Source record: 14856

hi guys,

I've got a bunch of Icom IC-F4s radios here, two of them, the channel display flashes constantly, and it doesn't seem to transmit or receive.

Another one, when i key up, the red light comes on for a brief second and goes off, and the display starts flashing. When I release tx, it stops flashing.

Are the radios simply locked out, or are they faulty?

When the display flashes, only the name flashes. Any indicators like "LOW" do not flash.

thanks!

2984. Wanted: Drake 2B preselector air variable cap

Apart from inadequate guying, the base should be buried well below the bottom triangular plate. The tower manufacturer spec's would give details. That tower is going to land on someone's head first storm. Glad it's not my neighborhood.

Source record: 14869
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I am going to betray my entry-level lack of understanding about the inner workings of radio electronics here, but my question (out of curiosity, more than anything else) is this: Ramsey Electronics offers kits for QRP transmitters for the 20, 30 and 40-meter bands (http://www.ramseyelectronics.com/cgi-bin/commerce.exe?preadd=action&key=QRP-SERIES)... they are dual crystal control (they provide one, and leave space for one more)-- is it the frequency of the crystal *only* determining the operating band in *these particular radios* (and they are being marketed as being for the different bands based on the frequency of the one crystal provided), or is it something relating to the other circuitry itself that (again, with these particular transmitters) that is determining the operating band? I read the .pdf manual on the Ramsey site, but I am still not certain.

Thanks for any insight-
Scott Anderson

He's got pretty high-res pictures, I zoomed one and he's not only got no thimbles for the guys at the turnbuckles, he's got his clamps on backwards (the saddles are intended to go against the load-bearing side of the cable). Pretty simple issues, wonder what the case is for more involved ones..

John

With the very light antenna load I don't see any issues. Certainly if a tree falls over there might be so would it be so if it was guyed to ground anchor points and a nearby tree still fell on it. I think you guys are making a mountain out of a mole hill.

I suppose also if a Boeing 747 crash-landed in this guys yard there would be an issue as well..but come on guys...this is no big deal so let's be practical. Frankly I've seen a lot worse and they have been up for years. And, moreover, if everyone erected strictly according to Rohn standards few of us could afford a simple 50 footer!

Obviously this Joe S. guy has no life since he has gone out of his way to start a new thread bashing this fella.

Hi Scott,

I don't blame you for being confused--the manuals have no schematic!
But the inductors and capacitors in several places (such as the
oscillator and the low pass filter on the ouput) are different for each
band model, so you would not be able to switch a unit to a different
band just by changing the crystal.

Hope this helps (probably not what you wanted to hear),

Glenn Dixon, AC7ZN

In general when you build a transmitter you need filters designed for
the frequency band -- if no where else, then there should be a final
filter that prevents harmonics getting out.

Yes, with "Winlink over Pactor III" being a very noticeable offender here, in that it happens to be so popular at the moment.

> It seems as if it would be very difficult to make these
> automated stations be friendly to other users.

SCAMP intends to address this, and it is a very important problem to be "fixed." There are many people who dislike the idea of using any amateur radio bands for linking Internet data/e-mail/etc. at all (my hypothesis is that they must not have been all that thrilled with packetmail either, but the Internet is the straw that's breaking their backs), but of those who aren't 100% opposed to the idea to begin with, Winlink not presently using busy detectors is a legitimate complaint.

> Both the pro and con in this argument are absolutely unwilling to listen
> to/believe the other side.

There's a lot of this going on, to be sure, but the fact that SCAMP is making slow and steady progress suggests that there are some level heads that will (hopefully) prevail.

This radio comes complete with the following.

Long 800 MHZ antenna
Ni-cad Battery pack
Motorola Rapid Charger (Model Number NLN4038)
I have tested the radio and the following simplex frequencies are
programmed.

858 MHZ
859 MHZ
859.5 MHZ
862 MHZ
862.5 MHZ
864 MHZ
865 MHZ

The Ni-cad pack can take and hold a charge,

If you read the manual, I believe they have one manual for all models, you insert different components based on which band you are building. The various bands require different components in the amplifier matching, output filter, etc circuits.

You apparently have little understanding of safe tower installation requirements, regardless of factory specs. This isn't a simple 50 foot installation... its a 90 foot tower, and when it comes down, its going to have a big effect on the neighbors. The wind loading of that tower preempts any problems with antenna loading. Given the poor base, and especially the lousey guying supports, its an accident waiting to happen.

Thanks for saying it. Three four-foot deep lumps of concrete are not a
sufficient anchor for a load like that. I gather there's a bit of wind every
so often in MI? Those feet will pop out like corks.

Here's some guys who thought it through a little better:
http://klickitat.ee.washington.edu/Tower/

This data is for self-supporting towers but it's interesting to note:
http://www.anwireless.com/tower.html#foundation

This is sorta relevant (it's a much bigger tower but is just plain neat:
http://greyfort.com/gallery/album12?page=3)

I mean, sure, we've all put up a dodgy 'tower' (I think my biggest self-made
piece of crap was maybe 8 metres high, and at least I was the only one hurt
during removal!), but this is serious shit, it could easily kill people when
it comes down. When, not if.

Message-ID: <81t3c1thule1kolc7ug1n0kj019i90qjl3@4ax.com>
Source record: 14889

All GMRS and FRS equipment must be certified by the FCC. It used to
be called "Type-Acceptance", but the current term is "Certified."
Here is a quote from the GMRS regs.

95.603 Certification required.
(a) Each GMRS transmitter (a transmitter that operates or is intended
to operate at a station authorized in the GMRS) must be type accepted.

You can buy a certified radio from RS and have it programmed for GMRS.
You can also bet next week's paycheck on the fact that the Motorola
radio sitting in front of you was type accepted before it was sold..
Motorola couldn't have sold it otherwise, and it wouldn't have been
available to you. If you look up that Motorola model on the FCC
website, you will be able to find the certification documents. You
also need the FCC ID number which should be on the serial number tag.

With this being a guyed tower I find it hard to believe that the feet will come out of the ground or do anything but sink farther into the ground do to the weight of the tower and the soft soil.

I put up a temporary tower in 1978 that is still standing. It is 50 foot high and is sitting right on the ground (about 8 inches in now). I have two sets of guy wires. I have 4 ants on it one being a 42 foot 20 Meter KLM. Also one leg is tied to a tree and one tied to an anchor in the roof of my wife's shop. The third in tied to two posts that are driven in the ground about 3 foot.

Now remember this was my temporary install of almost 30 years ago. Someday soon I am expecting to make it more permanent but.....

Tell me what happens to guy wire tension if the weight of the 90' tower
allows it to sink further into the ground?

We all know you go check the tower at least once a week for the 1st 3
months and then slightly less often unless weather gets rough , then you
tighten the turn buckles on the supporting cables , its not perfect but
it is up there.

I have a nice antenna tower for the taking/down. It is very similar to a Rohn 25. I think that it is stronger and is built very much the same. It has a Hazer mounted on it that was made for the Rohn 25. It is currently in Amarillo, Texas. It also has a nice house bracket and a ten foot mast as well as a home brew Jenpole. It has 3 guy wires, although they are not needed. I want the Hazer, but the rest is free to someone who will take it down. Contact me via my e-mail or phone 325-677-3675 to make arrangements to take it down. Thanks, Charlie Hugg, K5MBX

Gentlemen...

First of all a little clarification....

1. It is a 75 ft tower not a 90 ft tower (the mast is 21 ft)
2. It has a base of over 3000 lbs of concrete in the ground (.75 cubic yards)
3. Does my "90 ft tower" weigh any more than anyone else's "90 ft tower?"
4. If it settles then the guys will be tightened to compensate.
5. I have no neighbors near enough to have issues with a fallen tower. I'm in the country.
6. The tower is covered by our homeowner's insurance under the group of "outbuildings and other structures"
7. Yes..I am "proud of it".

Those that have been courteous and helpful..thank you very much. The others can just go fish....or any other appropriate phrase you may think of.

3028. New specially designed watt meter just for CB'ers!

Newsgroup: rec.radio.amateur.equipment
Date: 2005-06-29 16:54:15 UTC
From: dsofsofhd@aol.com
Message-ID: <42c2d212.13616229@127.0.0.1>
Source record: 14750

New specially designed watt meter just for CB'ers! It will read up to 10 gazillion watts and has four power range settings.

The engineer setting - 100 watts in reads 100 watts on the meter.

The bragging CB'er setting - 100 watts in reads 400 watts on the meter.

The Elkin setting - 100 watts in reads a dead key of 75 and swings to 750 watts.

The DaveMade setting - 100 watts in reads 1500 watts and then your amplifier blows up.

:)

Oops. I forgot one setting.

The Palomar Elite 300 setting - Your amplifier dead keys different
amounts from day to day, and your sideband audio sounds like crap.

Not all FCC type-accepted/certified UHF commercial-band radios are
certified for GMRS - I owned one, a King-Bendix portable - and upon
inquiring why, it turned out that the manufacturer applied for Part
90 (private land-mobile radio services) certification but overlooked
applying for the Part 95 certification because they weren't thinking.

**Agree, but cannot seem to find the right combination. Have to to admit
though, EBAY selling prices are high. Almost seems that people buying
some of the amateur equipment, especially for 2 meters, don't know
what they are buying. In certain cases, they are close to new prices.
Thanks for the data. Much appreciated.

Any transaction takes a seller who is willing to sell and a buyer who is willing to buy, and there seem to be a lot of them pairing up happily on eBay. The concept of "high" is all in the mind.

True, it is in the mind of the beholder, however, some of the
beholders have an unrealistic "feel" for what is going on around them.
In essence, they are simply not doing their "homework" when it comes
to pricing. Im certain the Ebay sellers are smiling all the way to the
bank. I would.

But Dan THAT would make too much SENSE! (grin)

The trouble is that the unattended robot train has already left the
station.
ARRL deliberately did this without carefully coinsidering the monster
that they created and now that they persuaded the FCC to go along
with it, the problem is too late to remedy.

One can only hope that they will learn from this horrendous blunder.
Looking at the latest proposal from this same committee, (segmenting
by bandwidth only) I see only more stupidity being foisted on a
majority by a small group in a smoke-filled room.

Most of us are finding out what they did each time, only after the
damage is done.

WHERE is even the basic polling of radio amateurs?
Did they ask amateurs in other countries that will be affected
by this?

Do 40m CW ops REALLY want to be HEMMED IN to the bottom 35 khZ?
OK the rules don't SAY that will happen, but if you give the
Mexican and VE SSB pests and the digital ops and MORE rope than
they have already taken, 40m CW could become a thing of the
past.

YMMV

I assumed you contacted your ARRL division director to make your views known? That's the mechanism by which decisions they make get input from everyday amateurs, so those amateurs' views can be represented in the "smoke-filled room".

After the ARRL's decision, how did your director explain to you how and why the decisions were made?

Or do you just sit and grouse and not bother to make your views known to someone who can actually do something about it?

P.S. If you identify yourself to your ARRL director only as "The Old Man", he's probably not going to pay much attention to you. And rightly so.

Very true. My point was that Motorola wouldn't sell a commercial or
GMRS radio that had not been certified. It's certainly possible it
wasn't certified to the desired band, but the OP stated that his
Motorola radio wasn't certified (to anything was the way I read it.)

Hi

I am new to amateur radio so I am having to get used to the new technology. I use a Yaesu FT-8800E.

I can access local repeaters but nothing happens if I try to turn on repeaters which are further afield.

I am also having problems turning on Echolinks. I have tried to use the Echolink frequency 145.2875. I key the mic and type into the mic and nearly always get a message saying the link does not exist. I have tried links which have just been closed down so I know the node exists. I always type in a # before the number but I wondered if there were any further settings I needed to adjust.

I hope someone can help.

Mick

First you need to know if there are any special access codes to enter.
The possibility of the machine not hearing all your codes....either you
are entering too fast or too slow for the machine. Check with the node
owner.

Hi guys,

Ugh, my news server dropped all the other responses. Hurrah for google groups! :)

The S model doesn't have the keyboard, but no matter, I made up a cable and found the software on the net. The radios were apparently programmed out of band. All good now, except for one radio which has really low audio. Could be defective, although im hoping it's just a modulation adjustment...

thanks guys!

From my perspective, I can copy CW very well with a narrow filter, even
with a large amount of QRM from a digital system.

And, the digital system is probably not going to be able to deal with
my interference half as well as I can deal with its.

Since I am reading this on rec.radio.amateur.boatanchors, where it is
crossposted, may I recommend the use of the audio filter on the Collins
R-390A? It is frighteningly effective at getting rid of this trash.

>I assumed you contacted your ARRL division director to make your views
>known?

Good answer, Roy. But I'm pretty sure that "The Old Man" isn't a League
member, or if he is, he takes no part in his Section. He said:

>> Most of us are finding out what they did each time, only after the damage
>> is done.

Certainly I heard about it well before hand, and expressed some concern, in
this case to our vice-director who happened to be dealing with this
particular issue. I got some additional feedback which reduced, but did not
eliminate, my concerns.

I suspect if "The Old Man" was on the radar of his section or division folks
as someone who was reasonably active, he would have had plenty of
opportunity for input early on. Most directors send out emails about stuff
like this to anyone in their division they suspect is active. Actually, if
I recall there was even a mention of this happening in QST well ahead of
time, but there is a lot of stuff in QST and something like this is easy to
miss.

Most folks, though, would rather bitch than take a few minutes to educate
their representatives. Kind of a shame, really, that so many folks can
spend so much energy bitching, but are unwilling to spend even a little
energy to make amateur radio better.

A frequency-hopping spread spectrum system with a reasonable amount of error correction won't be bothered much at all by iCW, as a matter of fact. :-)

Yes, but a frequency hopping system should recognize that this individual
channel is currently not good, and stop using it!

If it can, certainly... but it's the standard "near-far" problem in that you
may be able to hear the interferer (the FHSS system) but he can't hear you.

If your signal to the node is in any way noisy and you are sending long tones, the decoder may read that as several tones of the same digit. I hear it here. Some people think that pressing that button longer will help, but instead of a "4" the decoder gets "4444".

Try nodes with stronger, cleaner signals. Improve your own antenna setup if you are having problems with distant repeaters.

Brad.

Hi guys,

I observed that my IC-28H rig is a little def.

How can I increase the sensibility of my Icom IC-28H?

Are there any adjustment to do this or It only can be done using an
external preamp?

73,

Yvson - PR7BOK

I have a 28H sitting right here beside me. Been using it since it was purchased new, and I find the sensitivity to be excellent. It is not adjustable. You might want to look at the RF amplifier, Q4. It might have been blown by static or being too close to RF. The service manual is available here. http://www.mods.dk/

>friendly user group thanks for nothing...

There were two significant responses to your request, both posted in
June 26th, by Travis Jordan and by myself. You should be able to see
the whole thread using the following URL:

http://groups-beta.google.com/group/rec.radio.amateur.equipment/browse_thread/thread/45bb0
9796d91fb36/fe26bf4930e0ea50?q=group:rec.radio.*+author:dcolvey@shaw.ca&rnum=1&hl=en#fe26b
f4930e0ea50

Possibly there was a problem on whatever news server you use, which
prevented your from seeing them?

To summarize the responses:

- You can't use VHF marine radios for non-marine applications (at
least not here in the U.S.)

- MURS radios might be suitable, as they are VHF and do not require a
license (again, here in the U.S.)

- A lot of the cheaper GMRS radios are not really much better than
FRS radios, and may not suit your needs.

- Entry-level VHF ham radios can be had for about $100 each, and are
likely no more expensive than decent GMRS radios and are probably
cheaper than MURS radios. They do require licenses to use.
They're probably your best bet if all operators are (or are willing
to become) licensed amateur radio operators.

Why not put all the advertising inside ONE posting? It would be a lot more considerate. Some people consider your sale notices as spam, why not reduce the total number of intrusions?. The crossposting of commercial advertising is in bad form too.

Ya gotta understand Charlie that most of those complaining all live on
postage stamp lots, in cities, with neighbors. On the other hand, us
"Southerners" know better than to move into a antenna restricted
sub-division, with wall to wall covenants. They are to be felt sorry for.

I think your tower looks fine, when I get mine up this year I'll work you
on the 2 meter net.

Yes Some Mot Business band radios are certified for GMRS but beware of the bandwidth and power restrictions for that band vs. different model options. Forget about using the business band radios for FRS as they aren't compatible. Many GMRS/FRS radios are mode ambidextrous in order to be compatible.

Oh one more thing Charlie.

Several years ago I cobbled up a 25 and a 20G Rohn tower to make me a 90 footer.

Dug a 5 foot deep hole X 3' across and stuck a crappy looking section in it, Think I used about 12 bags of Quick Creet. Bracketed the next section to the house, and the crew stacked the rest and we guyed it with 3/8" twisted steel, turnbuckles and trailor tie down (6') long concreted in with 4 bags each.

Hung a full sized 20 meter monobander on it.

Stood three tornado's, four very strong straight line wind storms and stayed up for 6 years before I took it down to move.

The tornado's tore up two trees either side of it BTW.

On inspection found NO problems. Sold the whole mess, and its still up.

Source record: 14806

Hello all!
The maximum baudrate is 4800,using the FT-817Commander with the FT-817 and
CT-62 cable.When I set it to 9600 or 38400,the radio will not be found.
I use Win XP Pro and a PIII with 400 MHz

Any ideas which setttings have to be changed?

When you say you set 'it' to a baud rate other than 4800, what 'it' are
you talking about.

You need to set the baud rate on both the radio and the software
program.

It don't matter how I set the baud rate at the com port,the radio isn't
recognised unless I set the 817-Commander to 4800,the slowest setting.
Btw,how do you set the radio baud rate? There is no possibility on the
817.You can set the bps on Icom radios,but not with the 817

Looking for one..

Kenwood TS-430S optional filter YK-88A (AM 6KHz bandwidth)

Need for shut-in listening to SW broadcasts and the occasional AM
ham transmission.

The standard Kenwood AM filter is really the SSB filter which is
too narrow for AM BC SWL.

I realize this is an old part (1986), but maybe there is one out
there in a '430 that is only used for listening to SSB or CW (AM
TX does not require this filter, it's only used for wideband RX),
or maybe a junker TS-430S available I can rob one from.

Filter is plainly labeled and can be seen by removing the top of
the radio. May be marked "Trio" or "Kenwood" and will be marked
"AM FILTER YK-88A".

center frequency = 8831.5 KHz
passband = 6KHz @ -6dB
attenuation bandwidth = 11KHz >60dB

Thank you, any help would be appreciated, Please decode my e-mail
address below by removing spaces and subtituting @ for AT and .
for DOT (sorry spam is a real issue.)

Hello All,

I am trying to measure the phase noise of a VCO and hopefully
someone can clarify I have power ratings for the center frequency as
well as 10k and 100k [9.17 dBm, -6.28dBm (-15.45dBc), -43.96dBm
(-53.13dBc)].
I know Phase Noise is dBc/Hz, but I am struggling for a way to
actually calculate it. Any help would be greatly appreciated.

Unless you specifically want a Kenwood part for restoration originality,
etc.
There is always International Radio (INRAD)
http://www.qth.com/inrad/

International Radio is a supplier of custom designed, high performance
quartz crystal filters for communications receivers and transceivers.
Filters are available for communications receivers and transceivers. This
includes ICOM, Yaesu, Kenwood, Drake, Heath, as well as special designs for
experimental work.

These guys do nice work. I will suggest getting an 8 KC filter instead of
the 6 KC one, though. Noisier, but better-sounding.

I always advise my students that the most important accessories in their shacks are the manuals. If they buy used gear or they lose or damage the manual, I advise them to track down a manual from the manufacturer if possible or good quality copies. I also tell them don't skip it just because they may have to pay a price for them. Manuals are simply too important.

Tom - Do you know how to access the menu? If not, you are in bigger
trouble than just not being able to change the baud rate of the CTI.

3107. Query on Microphone

Recommendations for a mike that would be used with a Kenwood TS-820 and provide clean, clear audio. Presently using either the D-104 or the Heil headset/boom with the DX cartridge. Good reports with the processor off but bad reports with it on. Suggestions please and thanks? K3BEQ

I used the D-104 for several years on a TS-820

A problem with "reports" is -- HF non-Dxers wouldn't know good processing
from bad. Most will tell you turn off the processing.

A true DXer can access your audio -- have them give you a report.

Use headphones and the MONI switch to assess it yourself and keep the COMP
LEVEL down -- then advance for reasonable compressed audio -- worked for me.

--
CL -- I doubt, therefore I might be !

Good point. Completely forgot about the compression level know. Chalk
it up to a senior moment.

***Got hold of veteran dxer overseas and tried the Heil with the
processor on and various positions of the compression level knob. In
each position the report was the same. "With the compression on,
I lose 50% of my talk power". Seems there is a tremendous difference
with it off as opposed to on. Reports with the compression off are
excellent and very competitive in breaking through the pileups.
Perhaps there is a problem with the compression circuitry because
the reports are typically the other way around in my experiences with
the Kenwood 830S and 940S. Since it is a backup rig will simply use it
without compression. The Heil makes up for the difference. Thanks again.

I have a 4kHz one in my R5000 (compatible with the TS-430). I prefer that to
the Kenwood high qaulity 6kHz one.

My 430 has the filter so I can't test it, but if you look on the mods pages
you find a way of twisting knobs to get it to work without a filter.

You could also try the ts-430 yahoo group.

Geoff.

The FCC says that this guy must submit an EXPLANATION of why he said "shit" on the air on 2m FM simplex. Oh boy.

Are they listening to 11m CB or hams on 75m SSB at night?? Why pick on that guy?

http://www.fcc.gov/eb/FieldNotices/2003/DOC-249279A1.html

I think THEY should have to submit an explanation of why they ALLOWED shit on the air (BPL) - he he!

Hi, here you can find the manual:

http://www.rigpix.com/kenwood/r5000.htm

at page 16 you can find a table with the effects of various filter
combination, try using the selectivity switch ("7" on page 13) if you
find differences that maybe mate the ones listed on page 16. But if
you want to know what they are you have to open the radio; see at the
link above page 102 of the service manual part 2. If filters are there
you can fin their "numbers" on them.

> photo at: http://www.skylovers.org/Receivers/Kenwood-R-5000.jpg

It have been hurth! :-(

Ciao, excuse my English.

The major infraction was failure to identify - not the obscenity. Also, the enforcement letter you cite is only half of the transaction. The other ham with which he was in contact was cited for violations, too.

Hi,

I'm replying through the groups since someone might have information relevant to my filter and your needs.

I have a Kenwood YK-88A-1 which I used to used in my R-5000.

All of the filters in my R-5000 and TS-430 were interchangeable, except that the YK-88A-1 came on a small plug in PCB designed specifically to fit the R-5000 AM filter mounting.

I removed the PCB to use one of the SSB filters in my TS-450 which uses all plug in filters; which have the same designation as those in the TS-430 except for the "-1" which signifies the plug in PCB.

When I still had my TS-430 I compared the specs and found the only difference was the center frequencies of the CW filters.

I'm going into this explanation since the YK-88A-1 spec sheet shows a center frequency of 8830 kHz and as I recall from the TS-430 manual the only filter that differed was the CW one.

So - my conclusion, based on comparing AM, CW and SSB filters is that the YK-88A-1 should be identical to the YK-88A except for the plug in PCB, which I have removed. - it also has a part number of L71-0237-.5 and "8H3" stamped on the side.

If you are interested I'll be pleased to send you photos to help in your decision.

Comments and clarifications are invited.

Regards,
Dave

Pragmatically, the guy must submit an explanation because somebody reported
him to FCC, most likely via ARRL. No, "they" are not listening on 11 meters
nor apparently on 75. But I'd be willing to bet that if you recorded some
of this activity so that the 'culprits' could be identified then reported it
to your ARRL Official Observer Coordinator that they too could get a note
from the FCC.

Shit is in the dictionary. I found shit in the American Heritage
Dictionary, 1975. Shit means: To deceive or mislead, among other
things.

Why is everybody so uptight about shit?

3146. Realistic HTX-202 Shows Error

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-06 02:26:52 UTC
From: Kim_Jong_Il@volcanomail.com
Message-ID: <1120616812.738891.5520@z14g2000cwz.googlegroups.com>
Source record: 14669

I'm reviving this thread to add another data point. My HTX-202, not used for some time, is showing the "Er 1" error message. My owner's manual, date code 10A1, makes no mention of this on page 36.

That's no problem, as I saw the link posted the last time this was a thread at rrae. Thanks to all who posted with the solution to this problem, and to WB3QCK for providing the website with the lavish illustrations.

http://www.qsl.net/wb3gck/htx-202_err1.htm

Thanks again.

3147. Did Kenwood actually make the TM-2400?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-06 03:16:15 UTC
From: fmmck@aol.com
Message-ID: <fmmck-0507052316160001@ac8100c6.ipt.aol.com>
Source record: 14670

I came across a mention of a one watt 2400 Mhz FM transceiver made by Kenwood. There is a photo at http://www.rigpix.com/kenwood/tm2400.htm.

It appears to be a variant of the TM-642/742/942 tri-band rigs. I found references to it a Japanese Kenwood site, where the TM-2400 was mentioned among the rigs that use the various modules for the tri-banders.

Has anyone actually seen one? Was it produced? Is its band module available separately? I suspect the answers to these questions are all "NO" based on my web search.

73, Fred, K4DII

OK, he has been spamming this and other news groups but he does not
spoof or change his headers so why don't you just kill file him if it
bothers you? You only have to create one filter for him. There is far
worse on the news group. There are quite a few posting stupid,
disgusting off topic crap and flames all the time.

Careful now, your suggestion is logical, reasonable, and easy to do. I'm sure there is some Usenet rule against that. ;)

Technically, and scientifically, it would probably be quite correct to say
that virtually all of his large intestinal volume really is 100% full of
real shit. Possibly a large fraction of his small intestins, too,
depending on your definition of shit. After death, you ain't worth shit
anyway (except maybe a dollar's worth of calcium, iron, etc.).

There are exceptions (eg. just before colonoscopies, sigmoidoscopies,
situations of that nature, etc.)

I think everyone's shit stinks. So does everyone's gas. Bad breath is not
too nice, either. We all get BO sooner or later, too.

;-)

Note that the D-104 has a rising characteristic for the high frequencies and the Heil "Dream Machine" element actually places a 10dB rise at 2,000 Hz (a frequency the human ear is highly responsive to).

DXers and contesters have found this to be very effective for busting pileups. Listen to pileups -- the kids and YL's frequently get thru with the high pitched voices.

One might assess this as a loss of "talk power" but it is quite to the contrary. In fact
The HC-4 is THE choice for award-winning Contest and DX operators.

The stock mic for the TS-820 is indeed a great rag chew mic as is the Heil HC-5 "The Key Element"

The best of both can be found in the Heil mics that have both elements.

Usually for rag chewing, don't use the processor and a high frequency mic. But I wouldn't be without a high freq mic and processing when DXing or contesting.

Again I suggest you get a local real DXer or contester to assess your audio

Greetings

Since this is a group concerning equipment.. I have a question...I have an IC-22S which has a technical problem...

When in operation, it only operates in simplex....I have the front panel off so I could follow the wiring easier... The center pin, of the +duplex simplex -duplex switch goes to the diode matrix board.. even the schematic doesn't help from there...

The outside two wires, acording to the schematic go the other places....

Does anyone know what signals I should see on the outside two wires... I am not too concerned about whether they are the - or + duplex signals only what they should be...

HC-5 works well with most rigs it matches to. TS2000
allows additional EQ that is a bit cleaner than the HC-4. I find
that Bandwidth in excess of 2.6 is worthless and 2.4 is most
useful (2.2 kHz if I don't mind sounding like a girl to get
the DX).

I used a Shure 444 with my TS830 with good results for years.
With some trial and error and monitoring on a second receiver
much attenuated, I learned to keep the compression down to
6 db and it sounded great and clean by flattening the low
frequency components and sharply filtering below 400 Hz.
Switching to the HC-5 found little change with the
processor on because there is less energy in the lower end
to start with.

You need to compare the different mics when listening on
another RCVR. A difficult set-up, but worthwhile. Also it helps
to have a scope set up to monitor the envelope when
T-shooting the processor. It will give you a better appreciation
for what is going wrong. Proper mic selection and technique
can give as much intelligibility that can be had with processing.

I am using a Pro-Set to maintain the proper mic distance.

Hello Art,
This is only our second annual hamfest. Last year it was held in August, a day after the hurricane came thru. Our turnout was only about 300. Feedback so far this year says we should have between 500-750. Good odds for winning a door prize or the main drawing.
Worst case, we're only 6 miles from the 9/11 Flight 93 Crash Site / Memorial. That in itself would make the trip worth it. The Somerset

Somerfest is also running from Friday thru Sunday. Food, Music, Fun... I should work for the Chamber of Commerce...HiHi

Hope to see you here.

The line impedance can have any Zo. The antenna feedpoint impedance
can be any value of R+jX. Line length can be any fraction and number
of wavelengths. Line overall attenuation can be any value of dBs.

There is an SWR meter located at each end of the line. The meters also
indicate the reflection coefficients at the locations. Meter Zo can
be set equal to line Zo or to the standard 50 ohms.

Line input impedance can be observed to change versus line length in
wave-lengths, line attenuation and antenna impedance. The transforming
action of the line can be demonstrated. The smaller SWR and reflection
coefficient at the transmitter end of the line can be seen. The exact
increase in loss due to standing waves on the line is calculated.

The program can be used in practical applications and also for
educational purposes. It is hoped it may prevent the outbreaks in
violence which frequently occur in newsgroups about the meanings of
SWR and the notions of reflected power.

Download program SWRARGUE from website below in a few seconds. File
size = 41 Kbytes. Run immediately. No unzipping inconvenience.

That battery is soldered to the PC board inside the radio. Last time I had it replaced (98?) it cost me US$65.00 at the local shack. Next time I do it myself.

Larry-

I can't answer your question. I can only provide the stock reply for
IC-22S problems, and let you see if it can be applied.

It seems that the Phase Lock Loop PCB used stainless steel pins to connect
the front and back sides. Even if you succeed in soldering that
combination, the joint will eventually fail.

The solution is to take it apart, remove the pins and replace with wire
that can be soldered.

If your - or + duplex signals are connected to the PLL, they well could be
affected by poor connection of the feed-thru pins.

> Kenwood. There is a photo at http://www.rigpix.com/kenwood/tm2400.htm.
> Has anyone actually seen one? Was it produced?

I have seen several in Akihabara (which is the "electronics market district"
in Tokyo, Japan - if you ever go to Tokyo, be sure to visit it!).

It was remarkably expensive, I believe around Y200.000,-,
at a time that $1 was Y110.

It would be very nice if the manufacturers would consider making
equipment for the higher bands. There's little for the 23cm band
(FT911, FT912, TM833, IC81) and equipment for higher bands
is even harder.

Side-remark: If you are going to buy equipment in Akihabara, be aware
that a lot of the hamradio equipment is J-marked, as indicated by
a J in a triangle. The frequency limits of J-mark equipment are fixed
for the Japanese market and can't be changed by jumpers or diodes.
For Europe, this is fine as bands generally overlap (with the exception
of 1240-1260 Mhz which the Japanese don't have), but for USA folk
this could be a problem. Non-J-mark equipment is sometimes available,
but you need to ask and it's availability is spotty.
Changing J-mark to non-J-mark versions generally involves CPU replacement.

On the other hand, Akihabara _stocks_ equipment that is not even available,
for any price, in other places. This also applies for tools,
measuring equipment and accessories. There are several rigs that
aren't even sold overseas! Recommended.

How much do you want to spend? I could do it for $2 with latex, or if
you want spray enamel it would be $4.50

Spectra stuff for sale or trade:

ASN Encryption box:
TRN9843A DES CFB Hybrid module and ADV SEC ENC board intact.
[This hybrid will work in KVL's, Key Variable Loaders as well.]
Both Medeco keys included. If nothing else, here is a great source for
a DES Hybrid to use in your keyloader, and a couple of near pick-proof
lock/key tumblers for your other projects!
I have one of these boxes stripped of parts and bolted to my radio table,
blends in with the radio stuff
and makes a great safe for a billfold and small items. $30

SIU box:
The serial interface unit, YLN1120A, missing bracket, opens with
the standard 2135, not included. $20

HHCH MICROPHONE:
YCN4021A, round connector, UP/DN, SECURE/SCAN, R1/R2/OFF switches.
excellent condition, no cracks, well taken care of. $30

SIREN:
Systems 9000, HLN1185B unit
Siren to radio cable, HKN4763B
Including nice long power and speaker cables. $55

SIREN SWITCH box:
YLN4659A, Remote siren switch [not DEK], under-dash mount.
Toggles for Siren on/off, PA on/off, Yelp/Wail/Hi-Lo, and a phono mini-plug
for audio. Includes proper cable to SIU, uncut. $30

SPEAKER:
Well, its a brown speaker in excellent condition. No bracket, plug intact,
not cut. $12

CABLES:
YKN4239A, DUAL ADV SECURENET SW BOX, has DB15 on one end for the SIU, and a
16pin maxtrac-type on the other. Standard length, uncut.
Not a clue what this was for...? $12

YKN4237A, Your basic HHCH control head to SIU cable. Round connector and
DB25, ign wires, speaker wires, etc. All intact and uncut. Includes
"L-bracket" for mounting. $25

MOUNTING TRAYS:
2ea. Spectra mounting trays, excellent condition and clean. $25 ea.

ENHANCED CONTROL HEAD:
Not sure on the nomenclature, but it is a trunking head, HCN1047A,
has 3 rockers on bottom, strangely it's in excellent condition but the
lettering on the buttons is worn off. Lettering on the faceplate is perfect.
Untested, $40

VHF RADIOS:

2ea. VHF 110w Spectras, both needing repair, T83GXA7HA9AK,
radios only, no accys or trays.

1.) Intermittent RF board RX problem, otherwise fine. Buy before it's
stripped for $55

2.) Fail 01/90, No idea what happened, Buy before it's stripped for $40

Tell me what parts you want and make a reasonable offer for said part.
MLM I do not know, but I do know these radios can be HHCH or
A7/A9. Email for more info.

3.) 1ea. UHF 403-433MHz Spectra, HHCH, 110w, tested fine. Includes tray.
$55 or, make an offer on parts.

BUYER PAYS SHIPPING... figure $10 for stuff that fits into a flat-rate box.

Thanks!
rb

ADI AR-146 50W 2 Meter Amatuer Radio New in Box

I am an individual selling my own personal property, no resales or returned items or dubious origin to

worry about.

I bought two of these a while back at a hamfest for my two cars. I installed one and used it and really

liked it. The other car developed a few problems and I never got around to installing this one so it is

still in the original box never unpacked. I really like the one I use, it does everything I want in a

car radio.

Specifications

* Frequency Range - 144 to 148 Mhz
* Mode - F3E(FM)
* Antenna Impednce - 50 Ohm
* Power Requirements
o Transmit - 11A
o Receive - 0.6A
* Dimensions - 5 1/2" W x 1 37/64" H x 6 17/32" D (Projections Included)
* Weight - 2.65 Lbs
* Output Power
o HI - 50W
o MED - 10W
o LOW - 5W

Includes

* ADI AR-146 Radio
* DTMF Microphone
* Mounting Bracket and Hardware
* Power Cable
* Manual
* Original Box

Does anyone here know what size and type of battery is needed
to replace the one that keeps the freqcs stored (even when power is off)?
I mean in the PCS4000 model. Is it nicad/lithium or what?
Before I open it up wanna have a replacement in hand.

Joe

A quick interaction with google:

"http://www.the-battery-store.com/Azden Two-Way Radio.htm"

(Idiots that put spaces in URL's..... sigh....)

Pretty much the same battery (3.6V NiCad) that you can find for
cordless phones -- found in blister packs at (yeech) Radio Shack,
(YEECH!) WalMart (the "Made in China Store"), and others.

3205. Kenwood TS2000 Question

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-09 14:15:45 UTC
From: John <JohnASiegel@worldnet.att.net>
Message-ID: <42CFDC0E.6050100@worldnet.att.net>
Source record: 14728

According to the manual I read on line, the TS2000 has separate linear control and ALC input connections for HF and 6M. The HF control is a relay and the 6M control is an Open Collector circuit.

Anyone have experience or suggestions on how best to interface this with an Amplifier that covers HF and 6M with only one control line and ALC output. The control voltage and current are within the limits of the transceiver.

Would it make sense to just connect the two control lines in parallel? Not knowing the internal circuitry I am not sure what isolation might be needed for the ALC lines.

FWIW I went to the Kenwood site and tried the Contact Us link - it went nowhere. Is there an email address to try this question on Kenwood?
John

ADI AR-146 50W 2 Meter Amatuer Radio New in Box

I am an individual selling my own personal property, no resales or

returned items or dubious origin to worry about.

I bought two of these a while back at a hamfest for my two cars. I

installed one and used it and really liked it. The other car developed

a few problems and I never got around to installing this one so it is

still in the original box never unpacked. I really like the one I use,

it does everything I want in a car radio.

Specifications

* Frequency Range - 144 to 148 Mhz
* Mode - F3E(FM)
* Antenna Impednce - 50 Ohm
* Power Requirements
o Transmit - 11A
o Receive - 0.6A
* Dimensions - 5 1/2" W x 1 37/64" H x 6 17/32" D (Projections

Included)
* Weight - 2.65 Lbs
* Output Power
o HI - 50W
o MED - 10W
o LOW - 5W

Includes

* ADI AR-146 Radio
* DTMF Microphone
* Mounting Bracket and Hardware
* Power Cable
* Manual
* Original Box

Several years ago I bought a Yaesu FT8500 dual band transceiver at a close out sale. Before I could get it installed in the car, we had a house fire and and it was destroyed. This was the transceiver with the infamous Mr. Potatoe-Head microphone. I still would like to get one, if you have one that is in working condition, with the instruction manual, please let me know what you would accept for it.

Thanx - Paul

The all too clueless "cooltube" post a list of ancient crap FA.

Most of the time I just ingore your crap offereings.
But your rant got my attention.
Many, perhaps maybe most people in this and other NGs
already KNOW about Ebay. And go there to look for things
they want. Looking at this list I see very few things(1) that relate
directly to SW. Maybe you should at the trim your offerings to
stuff that is on topic.
Or even better, just stop posting this crap.

I make it a point to never buy from spammers and sir your
offereings are clearly spam. In the good old days jaber mouths
like you had their coax pinned. Too bad there is no similar
method of stoping you today.

Terry

LArry, Do you have a schematic for the 22s? If not I may be able help.
I have one though I can;'t put myy hands on it immediately.
Talk about bringing back memories!
That was a great radio in it's time except for the problems that
killed it. Through plated holes and pins that eventually would fail as
was pointed out by another contributor. Had a really nice receive with
helical resonators on the frront end.

Thirty years ago!! My age is showing!
Contact me if you need that print

3220. Re: Deviation for 12.5 kHz channel spacing?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-11 01:35:57 UTC
From: CWB <cboone@nospam.earthlink.net>
Message-ID: <12kAe.135797$PR6.111267@tornado.texas.rr.com>
Source record: 14743

Bandwidth = 2 x (dev + max freq of mod)...so 2x (4.5+3) = 15 kHz B/W, so 4.5kHz dev COULD work on 15 kHz spacing if everything was perfect (DEAD on freq, etc)....but this not a perfect world.....5 kHz dev will work in 20 kHz spacing but not a 15 kHz world!

For 3 k dev, it's 2x 3+3 or 12 kHz.....again ok for 12.5 kHz if everything was perfect...but the rcvrs probably arent filtered for that as well!
For 12.5 kHz spacing, the dev has to be lower like 2.5 kHz...but then your audio will be lower in the normal 20khz spaced radios...

Thanks for the further information. However, here is my problem: first, for me its a long drive one way (5-6 hours and I'd have to stay in a motel Sat night, come back home Sunday, PM). Then, I was driving around yesterday and the bigger problem: sticker shock at the gas pump (I was gazing at a sign that showed $2.30+/gal for low test regular) . I'd be spending more money on gas for the round trip than I'd expect to spend on goodies, toys, parts, etc at the fest itself. :-(

Buy the service manual. Internally, the ts 2000 has a similar
switching circuit for 6m and HF but adds a relay for HF. You should
know what to do when you see the circuit. A lot will depend on what
the amp needs.

In all honesty to those that ridiculed the tower and it's associated riggings etc...I have posted photos of the damage incurred from the category 4 hurricane Dennis. I never expected this kind of result...live and learn I suppose. Here is the direct link..

Your point would have been better if you had used actual before and
after pictures. If you check the name on each picture you will find that
they are the same exact file. Nice try...

Not sure what Charlie's point is -- the Dennis hurricane historical
map doesn't show it anywhere close to Union, Mississippi...

While the after picture may represent the condition of your tower after the storm, it is NOT an after picture. Why the false representation?

Because the images are virtually the same..even if I stepped outside and
shot a "true after" picture it would be the same image.

Sorry to disappoint all you guys but there was no damage here.....as all but
a very few "tower experts" predicted.

Looks like it was hitting Mississippi up around Columbus, and heading
North from you...

How high did your winds get ... in Union?

Bob,
The storm was not a pinpoint single line width across the map but over 3 0 0 m i l e s wide. I did not measure the "winds in Union". If they were not high enough for you then maybe better luck next time.

According to the storm category indications on the map at

http://www.wunderground.com/tropical/tracking/at200504.html

"Hurricane Dennis" was actually a "tropical depression" before it ever
crossed into Mississippi, some distance north of Union.

Charlie, I would never wish high winds upon anyone, but before you
brag about riding out a Category 4 Hurricane, you should be a little
more accurate in your terminology :-)

Have a good one...

Charlie, you may have noticed that the thread died once people realised you are out of town and not endangering anyone else. Good on you for putting up a tower out there, what the hell, eh? But the distortions aren't exactly helpful.

More to the point, how's the DX'ing? I used to have to go to a nearby mountainside road to get any height like you have now.

Cheers.

Ken

President Bush has authorized "Disaster Relief Funds" for 38 counties in
Mississippi including my county of Newton.
1. http://www.wtok.com/home/headlines/1678647.html

You cartographer skills as well as your meteorological powers of analysis
leave a lot to be desired.

Have a nice day.....sorry my tower did not collapse and that no one in my
family was killed. Maybe next time..eh?

Yep, those tropical depressions can be rough -- let us know next time
it rains in Union -- we'll want to see "before & after" pics of your
tower.

There are no distortions Ken. The tower looks the same the day before Dennis as it does now the day after. The WHOLE POINT in using 2 identical photos was to illustrate that there IS NO DIFFERENCE after the storm.

I have been on Usenet for 20 years or more and it is always the same....people just wait in the wings to take pot shots at others. I posted a link to the tower photos and all I got was ridicule and cuss words.

Now that it survived the affects of hurricane Dennis I get accusations that Dennis never even came near my home.
You guys can all go fish..or any other "F" word you might be able to think of.

Sorry to rob you all of the splendor of viewing my new tower down on the ground.

You fuckers are all a bunch of real sick bastards.

Just posting a real 'after' shot would have shut people up (well, most, as you say).

Anyway, still glad it didn't come down. My only beef was ever the neighbours - since they aren't in sight (and I notice you don't seem to have your house near it either) I say go for it.

Cheers.

Well, thanks again.

FWIW, it sure would be nice if for some of these fests
someone could go around, at the end, with a video camera or d-cam and take
pictures (something like for that URL of the last one) of the unsold major
stuff (and maybe guys selling parts?) and post these on the club website
as a "possibly still available" item and an email address (or something
like that).

All a guy would need is: a cardstock with price and email address in felt
tip pen ink, held in front of the gear. That shouldn't be too hard, or the
guy selling the stuff could provide his own jpeg images on a floppy disk.

I'm not particularly interested in eBay/auctionering stuff
(since you have to play the escalating price game, then the shipping
question, etc). But, if a guy said "Here is X, I'd like Y dollars for it,
and subject to negotiations" I could get more interested in this.

Art, W4PON

Just because the antenna wasn't damaged in this storm doesn't mean it
its installation is safe. So it withstood a storm whose biggest claim
to fame around her is flood damage.

Will the antenna stand the test of time?

Good luck
Plonk!

I have for sale a nice Kenwood TS-570SD. This is the one that covers 6 meters as well as all of the other HF Bands. Great General Coverage receiver too.
This transceiver works perfectly and looks good. There are a couple of small back spots in the trim ring around the front panel. Otherwise it is in great cosmetic condition. Comes with the original box, mobile mic, power cord. I do not have the manual but they can be downloaded from the Kenwoood webpage. Price is $775. Thanks, Charlie Hugg, K5MBX

While I'm not going to "plonk" you, I would advise you to get better guy anchors. Trees and utility poles aren't up to the task. If it was me, I'd set some 6 or 8 inch steel pipe about four to six feet into a BIG block of cement leaving six or seven feet out of the ground. Have lugs welded to the pipe and attach the guys to the lugs. This will get the guys up over head high and allow grass cutting and the like around the posts. When the tree comes down, so will your tower. Of course, using two different brands of tower section was just foolish, the money spent on making a possibly faulty adapter could have gone for another good section of tower. But, hey, it's your tower and your money. As for me and mine, good engineering practice takes precedence over make-do every time. Another amazing fact is that someone climbed up there to put it up and set antennas. It must have been a crazy man, as no sane tower-monkey would have climbed up there on two different tower sections and faulty guying. Be sure and post photos of the wreck when it comes down,eh.

R

No one wants your tower to fall down, nor harm to you or your family.
But you basically posted troll fodder and then have the audacity to
whine when it's not the attention you so wanted.

If you don't like the heat, don't post stupid things on Usenet.

I have a very good looking Kenwood TS-450SAT that does not work. It shows some things on the display, but no sound, no buttons work It is dead except for some letters and digits showing on the display when turned on.. This transceiver is from an estate and it has been stored for around 5 years. It was suppose to be working when taken out of service. I think it has some power supply problems probably from not being turned on for so long. This one has the built in Antenna Tuner and it all looks brand new on the inside. It has the original box and power cord, but no mic. Price is $285 plus shipping from 79602. Thanks,
Charlie Hugg, K5MBX

3254. FS Nice Kenwood TS-940SAT

I have for sale a very clean Kenwood TS-940SAT. This is from an estate and has been in storage for 10 years. It works great. No problems at all and great
audio. It has an optional CW Filter, original box, and AC power cord. No manual, but they can be downloaded from the Kenwood webpage. It looks great also. This transceiver is one fine radio. Price is $775 plus actual shipping costs. Thanks,Charlie Hugg, K5MBX

3255. FS Kenwood TS-120S Mobile HF Rig

Source record: 14637

I have been given this piece of equipment and I don't know what it is. At first glance it looks like some sort of RTTY interface. It is in a green metal case,has a big knob in the middle with slow on one end of the range and fast on the other, a range switch that toggles between LOW and HIGH,another knob on the bottom part of the face plate that has a range for Mark to Space, and a three position switch that says AC. The positions are off, on and hold on. Inside there are 4- "5963/12au7" 1- "OB2" and 1- "OA2" vacuum tubes, a transformer, and a high pressure mercury Western Electric relay. There are 2 - 1/4" jacks on the back labeled "Side-Tone Jack" and "Key Lever Jack". There are 2 pots also one labeled "DC BALANCE" and the other "SIDE-TONE volume. There is a label on the back that says "Ben Woodruff W9UE". I have looked up the call sign on the internet and it doesn't belong to Ben Woodruff any more. Just thought someone could help me figure out what this is!

Thanks in advance!

N9NAU

3265. Help: Problem with TS-830S

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-13 02:21:46 UTC
From: Chris <va3ut@rac.ca>
Message-ID: <YU_Ae.3097$6e3.390452@news20.bellglobal.com>
Source record: 14639

Thanks for reading this posting.

I need some help from experts. My TS-830S stopped transmitting. It was working fine until few months ago, then it shows a little delay on transmit. When I pressed PTT, the first couple of seconds get cut off in the beginning. After this point, everything seems working fine with good power. I thought it was caused by faulty driver or final tubes, so I replaced all three tubes. After I replaced all three tubes, the symptom disappeared but I ran into a new problem.

I was turning the TC1 trimmer to neutralize the final, and I saw a small sparks and smelled some burn. From this moment, no output power. When I turn the meter to Ip, it goes to infinite on transmit even if I try to adjust it using the BIAS pot. The voltage on the plate seems OK.

Does anyone know what the problem might be? I think one of resisters or caps got burned but I can't see it since the board is under the chassis. Should I take it apart and check it out?

Any input will be greatly appreciated. Thanks.

Chris VA3UT

NOT FOR DISASTER RELIEF FUNDS but Federal assistance for Debris Removal and Emergency services ... NOT A DISASTER AREA. Nice Exaggeration!

Additionally, Brown said the state and affected local governments in 23 counties are eligible to apply for federal funds to pay 100 percent of the approved costs for debris removal and emergency services related to the hurricane, including requested emergency work undertaken by the federal government, for a period of up to 72 hours.

The 23 counties designated eligible for the assistance include Clarke, Covington, Forrest, George, Greene, Hancock, Harrison, Jackson, Jefferson Davis, Jones, Kemper, Lamar, Lauderdale, Lowndes, Marion, Neshoba, Newton, Noxubee, Pearl River, Perry, Smith, Stone, and Walthall.

Well, this will be my last post on this thread. I think Charlie has burnt his last shred of credibility by using identical images for "before" and "after" evidence. I'm sure everyone noted that not even a single tree leaf was lost during that disaster, so I suppose Charlie could also claim that his tower is as strong as a leaf, maybe even stronger!

Since Charlie doesn't seem to worry too much about factual evidence, his request for technical comments must have been posted for entertainment value, and in that, he certainly has succeeded. Can we look forward to annual updates posting the same original image, thereby proving that Chuckie has not only built a strong, but an eternal tower?

Yeah, this is definitely my last post on the thread.

Charlie, you are a damn liar. If you go back to the record, you will find that I responded with cogent comment regarding legalities of encroachment, concerns about mechanical stress and inadequacies of base planning. For whatever personal reasons you have, you are incapable of accepting the realistic analyses that you requested.

Here Chuckie, print this and post it on your wall: You've got one tremendous tower, good buddy, and I'm proud to say that I live 2000 miles away from it, and you!

Hang tough & enjoy your tower Charlie!
If it breaks, fix it. Otherwise enjoy it!

Some day I may get brave and post the pictures of my fold over-crank
up mast with the CushCraft A3 beam on it. It waves around in the wind
like a sailboat mast and flexes the I-beam gantry enough to scare the
clueless when it is time to do antenna work.

When mine breaks, I will either fix or replace, just as I have always
done...

My current worries are lightning and ice.

It has only been up about five years, time will tell.

3282. What would cause the SWR to go up drastically when I turn my amp on?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-14 14:31:05 UTC
From: Joeseph <NOSPAM+++++@earthlink.net>
Message-ID: <cpscd1pntms4h0jgucumopkr80r98iotdu@4ax.com>

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

This is a very screwy problem. First lets get the set-up of my
radio equipment;

The amp puts out about 100 watts on HF.

RADIO----->2 TRANSISTOR AMP----->SWR METER------> ANTENNA

Note the SWR meter comes AFTER the 2 transistor amp.

Ok, when I check the SWR on my antenna it shows 1.1. When I turn the
amp on it shows over 3.x SWR. The antenna is rated at 5 KW. The amp
only puts out about 100 watts.

Hmmm.....Ok lets see what happens when I use my 1 KW oil filled dummy
load.

RADIO-----> 2 TRANSISTOR AMP---->SWR METER------->1 KW DUMMY LOAD

Same thing. The SWR is about 1.5 in to the dummy load, but as soon as
I turn the amp on the SWR meter shows 3.x plus.

Ok, Maybe my SWR meter is screwy, so lets use my Dentron MT3000
tuner with a built in 200 watt dry dummy load and built in SWR meter.

RADIO ---->2 TRANSISTOR AMP---->DENTRON MT3000

Same thing. The SWR is low without the amp on and goes high when the
amp gets turned on.

Ok, Lets see what happens when I use my Drake L-4B amp instead of the
2 transistor amp.

RADIO----->Drake L-4B----->SWR METER------->Dummy load

Now the SWR stays low when I turn on the Drake L-4B for both the 1 KW
dummy load and the external antenna.

The transistor uses MRF455 transistors. Why would the SWR meter go up
significantly when I turn on the 2 transisor amp, but stay low when I
turn on a Drake L-4B.

I've duplicated this scenario with three different SWR meters, and
different patch cables. Lets me say for the record the SWR meter
comes after the amp, so I'm not looking at a high SWR on the input
side of the amp. This is on the output side of the amp.

?????

Check the frequency (or frequencies) coming out of the amplifier. I will bet
that what comes out is not equal to what goes in. The antenna is not a
good match for those other frequencies.

What Bill is trying to tell you is that your amplifier is probably oscillating or putting out way bad harmonics. That certainly fits the symptoms with the antenna attached; it's a bit surprising with your dummy load unless the dummy load is only good to two meters (chances are your oscillation is higher than 2M, and harmonics certainly would be). You could also see odd results if the SWR meters aren't good beyond 2M, but I don't know which direction they tend to go with way high frequencies.

Smart guy you are! I never thought of that, but it makes perfect
sense. I don't have a spectrum analyzer, but since the 2nd harmonic
and higher lands above 30 MHz then I should be able to place my Barker
and Williamson low pass filter (30 MHz cut off) between the amp and
the SWR meter. Hopefully the low pass filter will allow the
fundamental through, and stop the higher frequencies (assuming they
are normal multiples of the fundamental frequency). If the
attenuation is great enough the SWR meter should not show the SWR jump
since the unwanted frequencies should be attenuated before they get to
the SWR meter.
Assuming you are correct my next problem will stopping the extra
frequencies from getting out of the amp in the first place.

J.

Your transistor amp is putting out garbage; transmitting harmonics that your
SWR Meter is responding to. You need tuning/lowpass filters on both input
and output.

Be sure to verify that it's not oscillating, and that any excessive
harmonics don't indicate some other problem with the amp (if you're in
the process of homebrewing it then it just means you forgot the dang
lowpass filter, but if the amp is a commercial unit & you're using it as
intended then there may be something broke).

No, your problem should be figuring out how to prevent them from getting generated in the first place. If the harmonic or spurious content is that high, there's something seriously wrong.

If I had to guess, I'd guess that your MRF455 amplifier may have some instability issues, and may have a nasty parasitic oscillation going on. You might also want to check its grounding, and the RF relay which I presume switches it into or out of the circuit. I'm guessing that you've got RF flowing where it shouldn't.

I picked up a few MRF455 transistors last year and have toyed with the idea of using them as a PA in a homebrew rig, but from what I can see in the application notes they require a goodly amount of care in the amplifier design and circuit layout. If they aren't used properly it looks to me as if they can be quite prone to misbehave, oscillate, etc.

If you can borrow a spectrum analyzer, take a careful look at the amp's output, and wave a probe around the amp itself (prior to the low-pass output filter). It would not surprise me if you find that you're spurring the horse a bit :-)

After reading all the other replies up to this moment, let me ask if you:
1. remove the radio (i.e. run the amp without the radio connected at all)
what do you get (if any reading of forward and/or reflected power), and
2. leave the radio connected to the amp, but run the amp without drive
power at all, then what do you get?
3. Can you vary the drive level (say down to lower levels) and still see
the SWR go up.
From what was written below, its not clear for sure if you are implying
that the amp did have a proper level of RF drive or not. But, I'd still be
interested in knowing if you get forward power and/or reflected power with
the amp turned on but without drive. I've actually had amplifiers where
the application of power and certain tuning conditions cause extra
frequencies to come out in addition to what was supposed to come out. And,
sometimes I got self-oscillation if the amplifier was NOT being driven
with input drive.

Damn! gusts to 59 and they get Federal disaster assistance? Hell, we had gusts that high in the past couple months on the Oregon coast. Maybe we ought to appy too?

>
> I have not seen much description on the solid state amp except that it has
MRF455 transistors. Because these devices were a favorite in the manufacture
of CB amplifiers, I am suspicious that the only output filtering is a HPF
set to cutoff around 30MHz.
So, running this amp on the lower HF bands would allow a lot of harmonic
energy to appear at the output.

> only puts out about 100 watts.

When I had this it was caused by arcing at the antenna. VSWR perfect with low power, but it even made an audible noise when you screwed the power up.

1 - Try this using a band-pass filter:
RADIO-->2 TRANSISTOR AMP-->SWR METER-->FILTER-->DUMMY
If amp churns out shit then the filter will reflect it. If VSWR is good, then:

2 - Eliminate your feeder (could be breaking down):
RADIO-->2 TRANSISTOR AMP-->SWR METER-->FEEDER-->DUMMY
When you do this you may even see a duff contact/joint.
If the feeder insulation is breaking down then VSWR rises again. If not then:

3 - Check out the antenna / balun / feed points for strands of wire, smoke, etc.

According to the weather map he was about 100 miles from the "eye" of
a tropical depression, which is one notch below a tropical storm.

Nice answer, Roy. That was my knee-jerk, too.

Joseph, remember, the problem isn't only "stopping them from getting out of the amp...". Those other frequencies are some sort of parasitic in the amplifier. Besides being stuff you don't want going to the antenna, they are robbing your amp of the ability to amplify the frequencies you DO want amplified, and they are unnecessarily heating up your transistors and sapping their life.

So first, keep them from being generated, then stiffen up that low pass filter so anything that does get created is way, way down. Far lower than what will show up as an apparent SWR problem.

I don't know your budget but you can get a brand new real ham radio that covers nine bands with 100 watts for around $545 - the Icom 718. It may not look as fancy as some of the CB base rigs but it will abosutlely blow them away in performance, particualry for the reciever. Going up from there and your options are many as far as rigs. --- Steve KK9ZZ

Congratulations, and welcome to the world of amateur radio.

Those two radios you listed are primarily sold to truckers and other illegal radio operators, not to real hams.

Consider an entry-level multi-band radio that will provide you with much broader horizons and a much better introduction to the breadth of ham radio. Examples include the Icom IC-718, Yaesu FT-840 or Kenwood TS-570.

> or Ranger-2890WX.

Don't be taken in by the flash of the Galaxy and Ranger. They are
really freeband radios. Some are sold to hams, most are modified to
work on freeband an used illegaly.

10 meters is truely a "magic band". 10 meter propigation is only there
when the sun is "hot". In the summer you get some international propigation,
during the late day (just before sunset is best). During the peak of
a sunspot cycle, you can get worldwide propigation all day and night.

When it's open 25 watts on SSB or CW and you are cooking. When it's dead
1000 watts on CW won't do much.

There are also 10 meter repeaters. Many of them existed before 2m
repeaters and are linked to them. Almost all of them now require a CTCSS
(PL) tone to work them.

When I lived in the Philly I had several conversations with people in
their car in Florida and the midwest using 2m and 440 fm rigs. I
was working them with a 10m FM transceiver. (TS-430). I also brought
my 10m FM handheld with me when I spent some time in D.C. and
worked a linked repeater on it.

If you don't want the FM capability, you should be able to get a Radio
Shack HTX-100 used pretty cheap. They have hot receivers and excelent
transmitters. They only do SSB and CW, but they do it well.

You might also look for a good used miltiband rig. I have a fondness
for Ten-Tec. You can get a Triton IV digital for less than $300.
It was made a long time ago, but there are many that are in good shape.
They lack the bells and whistles of more modern rigs, including
general coverage receivers, WARC bands (5mHz, 10mHz, 17 and 12 meters)
and FM. They do CW and SSB very well. Nothing IMHO beats tuning in
an SSB signal with a PTO (permably tuned oscilator (analog)).

Since you will have passed a morse test, you can get on CW and the
TenTec rigs do QSK (being able to hear the band) between dits and das,
better than anyone else.

If you haven't started to learn morse yet, buy a copy of "Code Quick".
It's the best way of learning morse code ever made and it's about $50.
For me it was the best investment in ham radio I ever made.

Geoff.

Hi Larry,
I intentionally posted the very same identical mage twice since there was no damage and no change in the image even had I taken one after the storm cleared. There was no damage here at all to the station in any way.

I NEVER realized my photographic prowess would cause such a stir which included accusations of "misrepresentation" "spoofing" "nice try" and comments about my "shit tower" "crappy installation" etc. I was even ridiculed for not "being in the eye of the hurricane". Gee maybe next time I can request a 200 mph cat 5 hurricane to plow through my backyard.

Be that as it may since human nature and the heart of man are such I simply wanted to show that there was absolutely no damage.

So to "prove" there was no damage here is a link to a snap I just took of the tower. Geesh Louise......

It may not reached that area but it was a large storm so you could get dmaging winds hundreds of miles from where the hurricane hit. While it looks like the pictures don't show damage, it could be further down.

Anyone know anything about the soon to be released (??) Icom IC-7000?
Is it going to be worth whatever price they are going to charge?
(Assuming it's going to be more than the 703 MkII....)

Maybe it'll depress the prices of the 703 MkII....

Tim

That is IC 706 MKIIG not 703. The IC 7000 isn't supposed to replace the 706 (yeah, right!). Irregardless it is naturally going to be above a grand for it.

3325. Attn Jonsey re PCS4000 mem battery

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-17 00:03:31 UTC
From: Joseph Fenn <jfenn@lava.net>
Message-ID: <Pine.BSI.4.61.0507161353480.12121@malasada.lava.net>
Source record: 14597

Jonesy,
Ref replaceing the built in nicad in the PCS4000 to retain the mem
chnls. I would never be able to find that small ni-cad type cell,
so instead I removed the strange 3 stack and routed two wires externally
to a standard lion wireless ph battery. They are kinda expensive at
about $19 at walmart, but the idead worked out great. The lion
will probably last a lot longer than any form of NI-cAD anyway.
Its 3 cells about size of a 3 AA batteries with little white clip
on them. Made sure I got all the +'s and -'s wired correctly.
Now it holds the memory like as if it was brand new. One more thing
however. You said to do a wide spread offset like
142.150 (up) and 143.450 (down) on the AFMARS voice repeater I am still
working on that. You said put the up fqcy in A chnl slot 1 and the
down freqcy in B chnl slot 1 then switch to A-B to get the proper
spred. Correct me if I am wrong.

I think the problem was that the thread was titled, AD5TH Tower -
Storm Damage Photos. So naturally we all assumed that there was storm
damage and you were going to show us the damage in the picture.
Apparently, you were trying to show something entirely different.
That the storm DIDN'T damage the tower. Perhaps you should have
titled it, "AD5TH Tower Escapes Storm Damage Photos." It would have
been easier to understand what you were trying to convey, and none of
these negative comments would have been triggered. Glad everything is
OK.

Yah know, Charlie, in retrospect, the only thing that bothers me about your installation is the one guy point as shown in 100_5463.jpg . It just looks a bit unsubstantial in the picture. I would grant that maybe in person, it might seem better.... however, thanks for the offer for free airfare, but I prefer the temps here on the Oregon coast.

I remind myself that we are amateurs, after all. As such, we might do
things differently from professionals or self-proclaimed professionals.

I also remind myself that this is Usenet, and it attracts all sorts of
opinions and posting styles. Not all of them are worth reading or replying.

Hmmmm thot it was you but guess not. Anyhow seems reasonable
that on odd splits you would use both a and b groups otherwise
can see no other way to do odd splits which are quite common on
MARS systems.

Junk to the core. Forget 'em.

> Thanx in advance & any info is appreciated.

It's nice to see another CBer "cross the bridge", welcome aboard and
best of luck to you Dennis.

The only 10M-only ham transceievers out there which I know about are
the Radio Shack series of adaptations of their 5 watt Realistic 11M CB
mobile rigs like their 25 watt HTX-100. Which is a lousy radio by most
hams' standards but they work and you can get one for around a hundred
bucks used. You can't beat that no way nohow on a budgetary basis
assuming that all you want out of ham radio at this point in your
development is a cheap and dirty way to get on 10M ssb and CW from
home. Which is a not a very good idea because 10M is dying fast at
this point in the sunspot cycle and you'll wind up talking to yourself
on 10M.

http://www.eham.net/reviews/detail/2158

At the risk of being another snotty supremely predjudiced old fart ham
who takes a very dim view of CB radio don't use the term "base station"
which is straight-up CB jive talk. Avoid it. Hams have "desktop rigs",
"mobile rigs, "portable rigs" and vhf/uhf handhelds.

In general you'll have to spend several hundred bucks more for a used
"real" MF/HF ham desktop rig. And a whole lot more on a new desktopper.
But in return you would get would get far better receiver performace,
usually 100 watts out, the ability to operate in the other nine ham
bands below 10M and in most cases you'd also be able to contiuously
tune for shortwave broadcasts and such and even your local AM stations.

There are gobs of those rigs out. Used version can be had for maybe
half of their MSRPs. I have an FT-847 which I bought new for $1,350 on
sale a couple years ago. You can get a used 847 for $700-800 by surfing
around the Web which is quite typical of the kinds of savings you can
find in the used gear market. With a bit of diligence you can find an
oldie but goodie desktopper which does it all for $300.

3339. Resistor frequency response

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-17 17:16:09 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <dbe3op$c1a$1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 14511

FREQUENCY RESPONSE OF RESISTORS.

Program METALFLM.exe 41 Kbytes.

This program models small low-wattage wire-ended resistors including spiralled metal-film resistors. The model's equivalent circuit is a chain of T and L networks. Values of lumped inductance and stray capacitance are estimated by the program from the component's physical dimensions.

The component with it's terminating leads is treated as a lumped L and C non-uniform transmission line. The program computes input impedance from 10 KHz up to 5 GHz with the other end grounded. Fast and slow frequency sweeps are available to observe maxima and minima of Zin.

Max and min Zin are approximately related to the physical length of the component, including connecting leads, but occur at frequencies far higher than the usual and useful working frequency range.

The reflection cefficient and standing-wave-ratio are calculated with reference to Zo, Zo being the DC value of the resistor. The usefulness of the component as a dummy load or for other purposes at any frequency can then be ascertained.

The effectiveness versus frequency of solid carbon-rod resistors and multi-turn UHF chokes, which are of similar wire-end construction, can also be determined. Chokes can be wound over the bodies of high-value wire-ended resistors, the parallel resistance value perhaps having some desirable effect on the ultimate response.

Another use for resistors having a good high frequency response, or at least a known frequency response, is for ratio arms and switched resistors in impedance bridges and other measuring instruments.

Download METALFLM in a few seconds and run immediately.

Other than saying the obvious - it's STD-Bus (old!), and has 8085 processor, serial parallel and relay interface, it's a little difficult to say much else unless someone here actually knows it personally. Do you know what it came out of? If you had a decompiler you could disassemble the code in the EPROM, but that'd be a last resort.

I did a quick search on "GEMS" and "MUDFET" but no result. The "multi contorl card" (note spelling mistake) may ring a bell with someone, but again, no result from a quick search. It may be an old monitoring card from GEMS Sensors (www.gemssensors.com) but that's a guess.

Ken

3345. FA: Kenwood TS-450S - Excellent Condition!

Source record: 14517

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5790387879

Silent Key Auction for Herb Petereit, W0AFY. If you knew Herb, you knew that he was one of the "old timers". One of his first jobs after moving to Omaha, Nebraska, in the 60's was building Galaxy V's at World Radio. He knew his gear inside and out, knew how everything worked, and took a lot of pride in keeping everything running in top shape. For many HAMS in the Omaha area in the 70's and 80's, Herb was the guy to go to when you needed help.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Kenwood TS-450S AT multi-mode (AM/FM/USB/LSB/CW/FSK) ham transceiver in great condition. It was Herb's secondary rig, so it didn't get much use. As far as I can tell, it never left his hamshack, and was usually covered. It comes with the original shipping box and documentation.

No sense in spending $3-400 for a one band rig, especially when the
sun spot cycle is declining and 10 meters is slowing down, when you
can spend about $5-6-700 for an all band HF-rig like an Icom 718,
Yeasu 840, Kenwood TS-50 or Alinco DX-77T.

Rangers and Galaxys are glorified CB rigs. You can do better.

Anyone parting out a Drake 2B receiver?

I need the following parts:

(1) "Preselector" air variable capacitor assembly
(2) crystal for 28.0 - 28.5 MHz (10m CW)
(3) crystal for 10.0 - 10.5 MHz (30m)

I suspect that 2A parts will also work.
I know that 4-Line parts will not work.

FS: I have about 5 or 6 legal size boxes of Marine radio service manuals. I got them from a friend who used to work at Radio Holland in Houston. They service shipboard radio equipment and when the ships dumped HF radios for satellite stuff he got a pile of their old manuals. No, I am not going to look for a specific manual in all that stuff but I am going to offer it all as one lot to whomever might need the stuff. Some of the names I saw in there (many more too) are Sailor, Motorola, Data Marine, SAIT, Marconi Marine, MacKay, Icom, Debeg, etc. If anyone is interested before I post it all on eBay, let me know. $125 takes all. Located in TX 77840.

I have a Collins 51S1-1 receiver in need of some mechanical parts for a restoration project, primarily needing the perferated metal case. Can anyone point me to a source for such parts? Thanks.

Well the crystals can be obtained from the normal crystal makers.

For the air variable - I would try Oren Elliott Products (largest mfg in US) - who supplied air variable capacitors for many manufacturers (Heath, Collins, etc.)
http://www.orenelliottproducts.com/capacito.htm

Hi Ed,

You might give the Collins Collectors Association reflector a try. Go
to www.collinsradio.org where you can sign up for the reflector
and then post a message with a want list.

Please let all of us know if all goes well with this guy and you have
the radio.
Seems to me and others that this guy is selling these high end radios
WAY to cheap.
Red flags are popping up all over the place!
I really hope he is on the up and up.
AND I hope you can pay with Paypal. At least
you will be able to get your money back.
All of his auctions are over now??
Good luck and let us know.

Thanks Larry. I will do just that. It looks like I've taken on a rather expensive proposition in the refurbishment of this old Rx given me. I hope it is worth it!

Hi,

I am selling my Force 12 sigma-5 Vertical dipole antenna on ebay.

I have the ability to ship it anywhere in the world.

To see the antenna click on this link:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5790843071&category=4672&ssPageName=WDVW&rd=1

If that link does no work for you, go to: http://ebay.com and do a
search for: force 12 sigma-5

Thanks for looking.

I know that I can buy crystals from the "usual suspects".
I was hoping someone had them lying around.

The air variable cap needs to come from a 2B. It's not
an off-the-shelf type of part, plus it has a built-in
vernier drive and the right shaft diameters, so I can't
use a generic part. Having one custom-built would cost
more than the radio is worth.

So... the search goes on...

3375. Review of Walmart Emergency Power Generator

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-20 20:07:56 UTC
From: fmmck@aol.com
Message-ID: <fmmck-2007051607560001@aca846b6.ipt.aol.com>
Source record: 14547

My trusty Sears/Generac 3500 watt generator worked like a champ in the 12 days I was out of power during one of last year's hurricanes. However it is too big to fit in my car to take to some other site such as on Field Day.

When I saw the 3000 watt generators in Walmart, they appeared to be small enough to fit in the trunk of my car, and looked well made. They are made in China, and carry the "ETQ" brand from Eastern Tools and Equipment company, model TG3000. They cost somewhat less than similar Sears, Briggs & Stratton, et cetera generators.

The generator comes with a manual, a tool kit in a pouch and a small round screen that may be intended to be installed in the exhaust pipe as a spark arrestor.

When I went to the ETQ web site (http://easterntools.com/), I noticed that this generator seems to be a stripped-down version of the one shown there. It has no volt meter, or 12 and 240 volt outlets. I haven't checked, but is possible there are two 120 volt windings that are connected in parallel.

There is also a question about whether the 3000 watts is peak or continuous power, depending on whether you go by the manual that came with it (peak) or the manual downloaded from the ETQ web site (continuous). Either way, I think it would handle my refrigerator and a few lights following another hurricane, or several Ham rigs at Field Day.

Using a couple of heating elements totaling 1250 watts, I measured the noise level. According to my Radio Shack sould level meter, the maximum level at about one meter distance, was 94 dB. The old Sears/Generac 3500 watt generator measured 99 dB SPL with the same load. You wouldn't want to sleep in a tent next to it, but it wouldn't be bad at the other end of a 50 foot extension cord. (Going from one meter to sixteen meters, roughly 50 feet, the level should be down 24 dB, to about 70 dB SPL.)

The most serious negative observation was that routine maintenance items appear to be proprietary. Part numbers given are ETQ3000TG62 for the spark plug, and ETQ3000TG76 for the air filter element. Five years from now when new ones are needed, will the company still be there? I expect there are commonly available parts that would work, but how can you be sure you have the right spark plug?

I remember when I was a youth there used to be loads of FM pirate radio stations round our way (Sheffield, UK). All the latest underground tunes were played - no commercial sh*t.

Nowadays there seems to be hardly any. What's the deal with that?

Me and my mates have been considering setting up our own FM station and we've come across this site:

http://www.broadcastrepublic.co.uk

They look like professionals to us and their prices seem pretty good - Transmitters from £280 and Complete Broadcast Packages from £600.

Anyone else used them?

Cheers,
k2

Floyd:

I'm going to share with you a series of emails between
extreemeelectronics and me. See attached exchanges.....but read from
"bottom up".

When I looked up the name Tabetha Betzner in Google, I found her listed as a 2004 HS graduate in Missouri: The Examiner: Lee's Summit High School graduates 05/22/04

Also listed as Doing Business As Clear Line Plumbing (shows address): DBID;CompanyNumb;CompanyName;Address;City;State;Zip;Phone;Fax ...

Finally, look at the one piece of (+) feedback they have: it comes from another person in the same city (Kansas City area), who is selling watches.....not good.

I agree that if you can fly there and pick up the item yourself, it's worth it. Be careful....you never know what's really going on.

I almost bid on one of these "deals", but held off. I'm an active eBayer: ID is webaron and my feedback is 352.....100% positives, no negatives in 6 yrs on eBay. I take buying/selling seriously and that's why I've been watching this Yahoo seller with interest.

Let me know what you find out, Floyd. Good luck.

Regards,

John Miller, K6MM

San Jose, CA

==========

Hello! Thank you for your email. Of course I understand that anytime people are doing business over the telephone or internet, it can be risky. The buyer that we did business with never paid or answered any emails. He never paid so no, nothing was shipped. My name is Tabetha. My father actually owned all of these products. We have hundreds and a list I can send you of all of the items we currently have in stock. He is ill with prostate cancer. He was able to continue business for about a year on his own since the illness but has since had a hard time. My husband and I have been handling everything for him in the past couple of months. We travel to different states to auctions (live). We mostly sell and but sometimes buy at the live auctions. Most of the time, if we get bulk items it is from a business that is going out of business or that has been seized. We do not just sell ham radios and such. We have many electronics. We sell laptops in our local newspaper. We don't sell them online because I have read many forums about people being burned by trying to buy laptops. No, we have never burned anyone and no, we do not have the desire to. That is for people who just want to make some quick money. We know that in the long run, you can make more money by happy customers telling their friends and also by them personally coming back to us because there is established trust. Bidpay is our preferred payment but as you have said, they do not accept transactions over $1000. We accept money orders, cashiers checks, and other like payments. Unfortunately, at this time we do not have an alternative. Our website is currently under construction and once it is

live, we will have our merchant account open in which we will be able to accept credit cards. You may want to wait until that time or until we establish more feedback. Thanks!

Tabetha Betzner

John Miller <webaron@starcrest.com> wrote:

Thanks for your quick response, but I'm disappointed that you won't send me a valid serial number.

Well, we can't use BidPay because they won't accept anything over $1,000 for a transaction, including shipping. That only leaves money orders or cashiers checks....which no one is comfortable with.

You seem to have a lot of high quality transceivers for sale at very low prices. That's obviously highly suspicious. Where are you getting these radios?

I noticed that at least one bidder whose ID is WA7AAX from Washington bought several items from you recently. Has he actually paid you and have you actually shipped them?

If you are legitimate, then you have nothing to hide. If not, then you are going to certainly attract a lot of attention from folks who have been burned in the past, and believe me, they will literally hunt you down.

You don't sign your emails.....what is your name? What is your telephone number?

You say that no one showed up to pick up the products on Sunday/Monday, but that you were willing to have them picked up at your location. Do you think folks are skeptical, and don't want to waste their time?

I'm a serious buyer. I've been on eBay for 6 years. My feedback rating is 352......100% positive feedback....no negatives. I don't screw around with buying or selling items on auctions.....I value my reputation too much.

I'm very interested in the following transceivers:

ICOM 756PRO3

Yaesu 7800

Yaesu FT- 847

What's your best price for each? Convince me to do business with you,

and I'll buy all three.

Subject: extremeelectronics seller on Yahoo

Hi Floyd:

Did you ever get in touch with them? I'm curious because of their

highly suspicious auctions of ham radio equipment at low prices on

Yahoo.

Thanks.

Here are some of the emails that I have collected.

I would not send any money another guy emailed and said he sent the
money..dont think he will see it again.

I have more if your interested.

Hi Floyd .. just wonder how that Extreme Electronics deal worked out
.. sure sounded fishy to me, and I could not find a store that fit that
merchandise in or around the Belton area.

What happened? Did you get your radio?

Subject: Re: extremeelectronics seller on Yahoo

Floyd:

I'm going to share with you a series of emails between
extreemeelectronics and me. See attached exchanges.....but read from
"bottom up".

When I looked up the name Tabetha Betzner in Google, I found her listed as a 2004 HS graduate in Missouri: The Examiner: Lee's Summit High School graduates 05/22/04

Also listed as Doing Business As Clear Line Plumbing (shows address): DBID;CompanyNumb;CompanyName;Address;City;State;Zip;Phone;Fax ...

Finally, look at the one piece of (+) feedback they have: it comes from another person in the same city (Kansas City area), who is selling watches.....not good.

I agree that if you can fly there and pick up the item yourself, it's worth it. Be careful....you never know what's really going on.

I almost bid on one of these "deals", but held off. I'm an active eBayer: ID is webaron and my feedback is 352.....100% positives, no negatives in 6 yrs on eBay. I take buying/selling seriously and that's why I've been watching this Yahoo seller with interest.

Let me know what you find out, Floyd. Good luck.

Regards,

John Miller, K6MM

San Jose, CA

==========

Hello! Thank you for your email. Of course I understand that anytime people are doing business over the telephone or internet, it can be risky. The buyer that we did business with never paid or answered any emails. He never paid so no, nothing was shipped. My name is Tabetha. My father actually owned all of these products. We have hundreds and a list I can send you of all of the items we currently have in stock. He is ill with prostate cancer. He was able to continue business for about a year on his own since the illness but has since had a hard time. My husband and I have been handling everything for him in the past couple of months. We travel to different states to auctions (live). We mostly sell and but sometimes buy at the live auctions. Most of the time, if we get bulk items it is from a business that is going out of business or that has been seized. We do not just sell ham radios and such. We have many electronics. We sell laptops in our local newspaper. We don't sell them online because I have read many forums about people being burned by trying to buy laptops. No, we have never burned anyone and no, we do not have the desire to. That is for people who just want to make some quick money. We know that in the long run, you can make more money by happy customers telling their friends and also by them personally coming back to us because there is established trust. Bidpay is our preferred payment but as you have said, they do not accept transactions over $1000. We accept money orders, cashiers checks, and other like payments. Unfortunately, at this time we do not have an alternative. Our website is currently under construction and once it is

live, we will have our merchant account open in which we will be able to accept credit cards. You may want to wait until that time or until we establish more feedback. Thanks!

Tabetha Betzner

John Miller <webaron@starcrest.com> wrote:

Thanks for your quick response, but I'm disappointed that you won't send me a valid serial number.

Well, we can't use BidPay because they won't accept anything over $1,000 for a transaction, including shipping. That only leaves money orders or cashiers checks....which no one is comfortable with.

You seem to have a lot of high quality transceivers for sale at very low prices. That's obviously highly suspicious. Where are you getting these radios?

I noticed that at least one bidder whose ID is WA7AAX from Washington bought several items from you recently. Has he actually paid you and have you actually shipped them?

If you are legitimate, then you have nothing to hide. If not, then you are going to certainly attract a lot of attention from folks who have been burned in the past, and believe me, they will literally hunt you down.

You don't sign your emails.....what is your name? What is your telephone number?

You say that no one showed up to pick up the products on Sunday/Monday, but that you were willing to have them picked up at your location. Do you think folks are skeptical, and don't want to waste their time?

I'm a serious buyer. I've been on eBay for 6 years. My feedback rating is 352......100% positive feedback....no negatives. I don't screw around with buying or selling items on auctions.....I value my reputation too much.

I'm very interested in the following transceivers:

ICOM 756PRO3

Yaesu 7800

Yaesu FT- 847

What's your best price for each? Convince me to do business with you,

and I'll buy all three.

I have a 200 that has never been touched.

Since I have had a stroke (at 49!) from high cholesterol, I am not able to box it up and ship it to have the latest mods.

I could have someone loads it in the back of my car however and take it to be modified with the updates.

My question is this: What place closest to Greenville, South Carolina does the mods on the SB 200. I am a teacher, but on a Saturday, I will gladly deliver it to whomever will modify it for me!!

Thanks!!

Please reply to my e-mail since I do not get to check this site often...

This doesn't directly address your question, but a really strange
story showed up in The Progressive. Clear Channel, the owner of about
1,200 radio stations in the U.S., tried to dupe listeners in Akron,
Ohio, by posing as an anti-corporate pirate radio station. "Via audio
trickery, Clear Channel made it sound as though some pirate radio
signals from 'Radio Free Ohio' were bleeding into several of the
stations it owns."

The 'pirate' signals were lashing out at corporate radio, and, of
course, there's no more corporate, conservative, right-wing owner of
radio stations in America than Clear Channel.

Weird.

I bought a new one about 15 or 18 months ago (lighted meters) and love it. Thinking about buying another to replace an older unit (of another brand) that doesn't have a remote sensor.

If I were the complaining type, the only things I could find wrong with it are the relatively open back (the "on" led can be lit by ambient light coming in through the window from behind the unit), and there have been a couple of times I would have preferred to unplug the remote head to reroute cables...

Operationally it's great, works fine and the calibration of the power meter was pretty close right out of the box.

Now that you bring it up, I should probably go ahead and order the second one while I have a few bucks in the equipment fund and before I forget...

Thanks

Collins 30S1 $1500.00. Buyer Collect from WA 98282

Has been my main station amp for the last 15 or so years.

>1200W output on all bands, using a 4CX1500B.

Works perfectly both electrically and mechanically.

Case has a few scratches but not bad for 40 years old, and has a hole drilled to access the bias control.

Emblem is missing.

Front panel, dials and meters look almost perfect.

Solid State Rectifier.

Solid State Time Delay Relay.

Military pull-out 4CX1500B. I have 3 of these. $150.00 each, or $400.00 for the 3.

New 4CX1500B. 1 only at $250.00

Buy the Amp and all the tubes for $2000.00. Buyer collect.

<k3ph@ptd.net> wrote:

> The web site seems to indicate 2.5 KW continous, 3 KW maximum.

Bob-

The Owner's Manual that came with the generator shows 3000 Watts maximum, 2300 Watts "rated" power. The manual that was downloaded from their web site says rated output 3.0 KW, maximum output 3.2 KW. The 2300 watt figure is the one I would rely on, but with such sloppy documentation, it could be higher.

There were several discrepancies between what I got and what the manual says.

-The manual shows a "dip stick" attached to the oil-fill cover but there is none on mine.

-The specifications indicate there is a choice between 120 Volts/19.2 Amps and 240 Volts/9.6 Amps. That does not appear to be correct. There is only one 120 Volt winding, not two wired in parallel.

-The manual shows a choke rod that is pulled for choke, pushed for run. In fact there is a lever that is flipped to the right to choke and left to run.

-In one place the manual shows an air filter that unsnaps for servicing. In fact the cover has screws attaching it, which is shown correctly in the mechanical assembly picture.

-The manual suggests that you drain the carbureter before storing the generator. However, the method it shows does not appear to be possible on mine.

I believe the manual may have been assembled from parts of other manuals, not created for this specific machine.

As Justin suggested, I plan to look for an equivalent spark plug. The one in mine is marked "LD F7TC". I found that the F7TC is made by two Chinese companies, SG and LD. However, the only source is an importer with a 10,000 plug minimum order! Then there was a discrepancy in the importer's picture of the plug. Mine has a threaded electrode (even though it uses a push-on cap), but the picture did not have a threaded electrode unless there is a piece that unscrews. I found one reference to an NGK BPR7ES as a possible equivalent, but there was a huge disclaimer message associated with it.

Bob-

Thanks for the tip. You were apparently more successful than I at finding data on the F7TC.

Using the Bosch W7BC number with a search engine, I found the Enker web site, that had a cross reference between several companies. Their list also includes some dimensional data. Unfortunately the W7BC plug has only a 1/2 inch threaded "reach". The F7TC has a 3/4 inch thread, if I understand what they mean by reach. (The Bosch W7CC and NKG B7ES are plugs that fall in this category.)

The plug is gapped at 0.030". Thread diameter appears to be 13.7 mm, but I think it is within tolerance of the common 14mm. The top electrode appears to match a 36 tpi thread guage. An 8-32 nut doesn't quite fit. I think it is a metric thread, 3.5 mm OD with a pitch of 1.4 or 1.5 mm.

I measured the DC resistance between the top electrode and where it comes out the bottom. The reading was around 2 Ohms, but that could be the result of contact resistance. I assume it is not a resistance-type plug.

> Me thinks charlie is a kook.

With all this attention, one might think that someone in his county might hear of this and take a second look at the engineering. It might be true that being in the boonies, nobody really cared at the time when Charlie said he was goin' to put up a tower, But now that it is there, looking like a ride at CB World, they might want to review it. We also need to keep an eye on the SK list. Something could happen to innocent folks if it falls the wrong direction, and in my experience there is no right direction for a tower to fall.

Now now Mr. Ace .. those are such harsh words.

Perhaps we should call for testimonials from users of the Tiny-Tenna.
Get the info first hand. They could check in with basic info:
- name
- location
- what's the DX-iest station they ever heard with their Tiny-Tenna.
- what radio they use with their tiny-tenna
- do they wish the FCC would dump the code test from a ham license.

We could even give prizes.
First prize - Kevin will mention your name on The Great Liberty Net.
Second prize - Kind Jewish Indian will mention your name to "the
friendlies".
Third prize - the Tiny-Tenna user gets to hang out with Nashville Joe
at the Huntsville hamfest.

There - that oughta bring out a few million testimonials. We predict
(no pun intended) that they'd all be from Mr. Davies, though.

I happened across these comments on the D104 mic buffer. For now, the ampmicro website is dead. But, I still sell the amp buffers, and I provide support for fixes and modifications for users, new or from re-sale.

I have modified the circuit slightly since '99 to enhance bass response. Also, there is a FET based amplifier that works in some applications, but the author missed two points regarding my buffer:

1.) The FET buffer is single-ended, mine is balanced, which is the Astatic D104 cartridge configuration.

2.) The FET consumes considerable more power. The op-amp I use is a micro power device, allowing it to run from a 9V battery for months, or from a power take-off from an electret cartridge-biased mic input such as what is used by Icom.

You can contact me at k0sf@arrl.net for additional info. The buffer sells for $30 wired and tested, plus $5 shipping and handling in CONUS.

Hey man you leave Wayne Greene outa thissa here argy-ment. Wayne's a hero. A legend in his own mind .. I mean ... time.

You shoulda been there. Atlanta hamfest in the late 1970s. When it was held at the old Marriott. He was a forum speaker there. We dropped in 2 years in a row - 1977 &1978. It was when "hobby computers", as he called them, were first coming on. Both times he announced (emphatically) that he was going to become a billionaire (he emphisized the "b") writing computer games. (To this day I wonder if Bill Gates is feeling the heat of Mr. Greene's impending takeover.)

The 2nd year, he announced that his ex had just cleaned his clock in the divorce by taking Byte magazine from him. No problem - Kilobaud was gonna blow their doors off. He'd show her who could put out a computer magazine. Yeah right. Hey I Wonder what a complete collection of Kilobaud's would fetch on ebay. Har har har.

After one of the "seminars" we were even fortunate enough to ride the same elevator as Mr. Green and his entourage. Hmmm .. wonder what ever became of Sherry. We were guessing she was the cause of "the divorce". She was no Pamela Anderson, but for Mr. Greene, she was quite a fine specimen of "the younger woman".

Hello All:

I'm looking for any info that anyone in the group here has regarding the Ten-Tec Pegasus Model 550 Computer controlled HF rig.

Pro and Con

Looking for info also on this radio's Bandpass abilities. Rejecting very strong RF on other band. BC band overload ?? rejection ability. Ham band overload ??

I've read the EHAM reviews. Just looking for as much info before i decide if i want to deal for one.

Also, does anyone know if the optional keypad/rotorary dial thing can still be bought ??

Thanks to all that respond.

3430. Bird Watt Meter Slugs

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-24 02:54:07 UTC
From: "Murray Green, K3BEQ" <mgreen@erols.com>
Message-ID: <42E302CF.A4612B0A@erols.com>
Source record: 14403

Another ham friend and me both have 100 w slugs for 100-250 Mhz. (100c).
Both are bad. Tests were made on three different Bird meters and a 3rd
slug known to be good.

On all 3 meters inputting 100 w, the good slug showed 100 watts while
the two bad ones showed 70 w and 60 w respectively. Pretty high odds
that we both would have faulty slugs eh?

So the questions are: what happened to make them go bad, and can they
be reasonably repaired by the Bird Corporation? Although we will
be calling Bird personnel next week I thought I would throw out the
question here.

Last but not least, any good 100w 100-250 Mhz slugs out there for sale?

You did test them into a good dummy load ? Anyway if you peel back the
label there is an adjusting screw. YOu may be able to adjust that to match
the known good slug. That adjustment is a small pot.

Could have been as simple as dropping them -- which is why I'm hesitant to buy slugs at hamfests if I can't check 'em out. Don't remember what frequency the crossover occurs, but at a fairly low frequency, around 2 meters iirc, coupling in the slug changes from a variable capacitor that's adjusted to making the adjustment by moving the coupling element.

The coupling adjustment is underneath the label on the top of the slug.

Bird used to offer a recal service that was fairly reasonable.

Oh, and you are using a good dummy load for those tests, like a Bird dummy load that's still providing a flat 50 ohm load at your test frequency, right?

(I've got a "new" Bird -- it's only about 30 years old.)

I took the original plug down to an auto parts store. Between their cross-referencing and what we did prefiously here, the closest plug seems to be the NGK BP7ES. Physically it appears to be identical, and the top electrode unscrews to reveal a thread like the F7TC electrode.

I bought one with the idea of saving the original and using the replacement. However, when I tried to start the generator with the new plug, the recoil starter mechanism broke!

It seems that the spring assembly was spot welded in four places to the housing cover. I suspect three out of four welds were completely defective, and the fourth didn't last long. It may have been the fourth or fifth time I tried to start the generator.

I didn't want to go to the trouble of shipping a heavy generator to some repair depot, so I took it back to Walmart for a refund. I will miss having a generator that is just small enough to fit into the trunk of a Toyota Corolla, yet is capable of supplying a modest amount of power. However, another copy of the same generator, or a new recoil starter mechanism, is likely to fail again for the same reason. I certainly can't recommend getting one after this experience.

Do a Google search on the subject. You will find plenty of information on this if you use the right search words. I suspect the resistor or diode in the slugs are bad. Here is one ham's (now defunct) website info I got off a Google cache:

Ed

Inside Those Bird Slugs

Did you ever end up with or do you now have a dead Bird slug? No, not the kind you have in your shotgun but the kind which fits inside the Bird Wattmeter series which makes them so valuable. Have you ever wondered what was inside them? Well, I had one which I purchased at a hamfest ("Is it working OK?" "Sure, it is. I used it right before I headed down here to the hamfest.") I foolishly believed the seller but once I tested it at home, I realized that I had a dead slug. I have since found a way to test them before paying the money and I'll be glad to share that info later.

In addition, I was always curious as to what was on the insides of those little beasts. After all, what could be inside to make that little thing worth so much money? Since mine was dead, and I had little to lose, I opened it up to see. I will share with you the inside story, and I now know why they are so dear to the pocketbook.

I did not take this project lightly. I spent long hours searching the Internet but was never able to find any information on the slugs themselves, either pictures or text, to describe what the folks in Cleveland placed inside those little gold cylinders. I hope this article can save someone else some search time if they attempt the same endeavor.

First, to test a Bird slug (assuming that you are going to a hamfest), take along a small VOM that has, at least, a resistance scale. If the seller (assuming you are also buying at a hamfest) will allow you to test it, place the VOM on a higher resistance scale (I used the 20K scale on the little yellow $9 marvel I had). Hold the slug in one hand and place one probe on the round shell of the slug while carefully touching one of the small connection which is exposed on one side. Then reverse the VOM leads. Test it just like you would test a diode -- you want continuity in one direction and an open connection the other way. Then test the

connection on the other side of the slug the same way, expecting the same results. If you find continuity, or a very low resistance, from the shell to a connection in both directions, something is shorted in the slug. If you find no continuity in either direction, something is open in the slug. Either way will cause it not to work. On the one I had, I had no continuity.

Over a period of months I would pick that slug up and try to twist, poke, pull and generally try to see how to get inside it to see if anything was obviously gone. It resisted my every attempt. My wife would have said, "throw it away... it isn't any good. Just forget the money that you wasted on it.....It's gone!"

I don't think so. 'Course I really didn't tell her that I bought a dud so she didn't actually say that. Finally, over a year past the original purchase, I decided to take drastic steps. After all, it's dead anyway ---- what can I hurt?

Carefully examining the dead slug revealed that someone had used some type of grinding tool on the face of the slug on two sides. (I know, I know, I should have seen that sooner.....and especially before I bought it.....) The two round grinding spots were within the arrow which seems to be on all Bird slugs showing which direction it is to be turned. One was directly within the arrow head and the other at the opposite, tail side of the arrow.

With my Dremel tool and several different bits and stones, I was able to grind down past the aluminum disk which is the label, and pop the label disk off. I regret that when this activity took place, I did not own a digital camera so I have no actual pictures of the following steps. Even though I now have a camera, I cannot bring myself to re-enter the slug, just to get pictures. I will attempt to be, in words, as descriptive as a camera would have been in pictures.

Once the label disk was off, it revealed a cavity in the center with a single screw which was covered with a sealer to show whether it had been "messed with." Again, nothing to lose so I unscrewed that screw which released the larger circular part of the slug. This is the widest part of the slug which has the grooves and is gripped to rotate the slug in the wattmeter housing.

Once the finger piece was off, I could see a 1/2 watt resistor with a piece of spaghetti over one lead. It was soldered on one side to a small terminal which was one of the two connection pieces which are always visible on the side. The other lead of the resistor connected to another terminal and on to the top of a diode coming through the remaining part of the slug.

Two more screws were also revealed and once they were removed, the white nylon cover which shielded the primary RF detection pieces was removable. This round white piece of nylon is the piece which you see on the lower section of all Bird slugs. The slug I had was a 50C which was calibrated

for 50 watts in the range of 100-250 MHz.

The RF detection parts were a 1 1/2 turn coil of about #18 silver plated wire connected to the diode on one end and a flat feed-thru capacitor on the other. The white nylon cover was actually a machined-out piece with room to go around the coil and feed-thru. I had originally thought it to be just an inverted bowl-type cover but it is much more rugged than that.

I did not bother the coil or other parts inside the slug once I realized that my problem was an open resistor. This resistor was marked 14K 1% and had, no doubt, gotten too hot from excessive power so it opened up. As Fortune had smiled upon me, I had an exact replacement resistor which helped to speed the repair. I carefully bent the leads on the replacement resistor to look exactly like the one it was replacing. The defective resistor was easily and quickly removed and the replacement fit back perfectly. I tried to use the least amount of heat on the connections so as not to risk changing the value of the resistor.

Putting things back together, everything fit fine and there were no left-over pieces (unlike some of my previous projects). The slug was tried and worked as it was supposed to. At least, it read upscale when power was applied through the wattmeter connectors.

Bird slugs are expensive because they are manufactured to close tolerances and I imagine it takes quite a bit of time (Time = $$$$) to assure the accuracy to which users have come to expect of Bird products. My repaired slug certainly did read something but there was no assurance that it would anywhere near the accuracy that was demanded of that unit. I compared the repaired slug to another I had which covered the same range and they read to same values. Yes, since that one had been defective and I still needed that value, I had purchased another. The repaired slug read the same as the untouched, other one which had become its replacement. Lucky? Probably. Happy? Absolutely!!

Had I been able to verify the contents and inner make-up of the Bird slug earlier, that is, if I could have read what you just read, I would have started the repairs much sooner. It may be that I was just lucky and attempting this project again on a different dud slug would have resulted in a much different outcome. I was, however, very pleased with the final result on this particular attempt. If you attempt the same, I hope you have similar success because, as we all know, "A Bird in the hand is..... oh, never mind....." ----- K5LAD

Murray-

I've had a couple slugs go bad. One I was able to perform surgery on, and it appears to be repaired. Neither had the problem you are seeing.

I would be careful about drawing a conclusion based only on what you have seen. Consider that the combination of slug and meter is only accurate to 5 percent of full scale. This gives you a ten watt spread right off the bat, even if all met specifications. And you must make comparisons using the same setup with only the slugs changed between readings.

You didn't say it, but I assume the "good" slug is also a 100C. What makes you think that the one reading 100 Watts is correct? Do you have a 100 watt rig that you trust to be putting out exactly that power? Even if it is, that depends on your power supply putting out exactly 13.8 volts. You may find that a slight drop in power supply voltage can produce a radical drop in power output. If it is in your vehicle, it can easily make thirty watts difference between having the engine running and not.

I suggest you put off trying Ralph's suggestion until you determine if Bird will correct the problem, and don't be surprised if there is some simple explanation about the discrepancy in readings.

Thanks for reply. Yes, we will definitley contact Bird first.
On the 100 watts it was absolute, of that you can be assured. Again
thanks.

I had a 250 watt HF slug that went bad for no good reason. It was
about 20 years old, but hadn't been dropped or anything. Just started
registering 160 watts on a 100 watt rig. Figured getting it
recalibrated would cost more than a new slug, so simply bought a new
slug.

As I understand it, the Jupiter is the same as the Pegasus, but with a
front panel & knobs. The Eham reviews on the Jupiter are amazingly
varied; some love it, some hate it. You may just have to try the
Pegasus on a trial basis, if possible, and not take anyone else's word
on it.

Harrrray for curiosity!!!!
Just a FYI you might check out the Directional coupler project from ARRL Handbook 1974 page 636.
This is the homebrew version of the Brand Name Bird. But it can give a good understanding of what's happening.
If you have time and a friend to help calibrate your project. Works great. Lasts long time.

http://personal.atl.bellsouth.net/m/e/metacalv/Directionalcoupler.html

After you build one.... it's just like most other electronic gear... Buying one made for how ever much money is
just convenience. Well I retired now... more time than money hi hi

My car has an extra radio slot into which I'd like to put a
2-meter/440 combo unit.
Does anyone make a unit to fit a standard-sized vehicle mounting?

Vehicle is a 1997 E320. The original cell phone & controller are going
to be removed. They're FS if anyone is interested. :)

Also, if you are looking for a replacement broadcast radio for your
car, these units (I think they're Alpine) have a WB feature. It was
great to have as I drove into Madison, WI, on Sat. while that
nasty-looking front was moving in @ 60 - 85 mph.

3455. Update on Bird Watt Meter Slug

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-25 16:11:27 UTC
From: "Murray Green, K3BEQ" <mgreen@erols.com>
Message-ID: <42E50F2F.377F234@erols.com>
Source record: 14428

Thanks to all for your comments on the faulty 100-250 Mhz 100 watt
Bird Slug. (100c)

My ham friend and I made separate calls to Bird Corporation and talked
to two Bird Corporation technicians Monday morning. Both believe it is
a deteriorated diode that is causing the lower readings. The slugs
are rated at +/- 5%.

The pot underneath the label tab is for recalibration purposes and
and has to be adjusted carefully. However it will not correct a bad
or deteriorating diode. They will recalibrate for $50 but no longer
repair slugs. A new slug is $75 plus shipping from their distributors.
Slightly less if you have an account with them.

Again thanks for all of your inputs.
73 K3BEQ

3456. question about making backup of FT-7800 programming software

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-25 16:23:41 UTC
From: filegrabber <p2pis@good.gov>
Message-ID: <Xns969E5F91B4CD1p2pisgoodgov@216.196.97.142>
Source record: 14429

I don't know if this is a good group to post this in, if not
please direct me to a propper group.
I'm trying to make a backup copy of the programming software for the
Yaesu FT-7800 mobile radio.
This programming software comes on a minidisc which I might ad is the
first program I've seen come on this type of media.
I first tried to make an image of this disc using cloneCD, however I'm
guessing because the image was unreadable, that cloneCD doesn't support
minidisc image creation.
So then I actually went in to the disc and copied the setup file from the
disc to one of my hard drives.
I then burned it on to a regular CD and handed it to a friend so he could
use it.
I guess I should've tested the instalation first before I handed my
friend the CD though, because a while later he calls me up saying the
installation did not work.
Since I had installed the program on my computer from the original
minidisc, I was a bit stunned.
So I offered to go through the install process with my friend so I could
see if I have the same problems he did.
So I launch the setup file from my hard drive since that's the file my
friend had on the CD I made him, and sure enough,
after entering the serial number just as it appeared on the minidisc
package, the same serial that I installed to my computer via the minidisc
just fine, an error came up saying that the code was invalid! This was
the same problem my friend was having when he tried to install from the
CD I made him.
I thought this was odd, since the setup file used in both the CD I made
my friend and the install file on my hard drive was the same file as the
setup file on the original minidisc!
Upon closer checking I discovered that somehow the setup fiile when
launched generates I guess some sort of checksum for the media being
installed from because when I launched the setup installer from 1 of my
hard drives, when I got to the enter serial box I saw the following:
Please enter the serial number for Advanced Data
Management Software into the fields below.
0C85-8C66
I thought those numbers looked interesting so I put the install file on
my other hard drive and launched it, when I got to the enter serial box
on that drive, I got this:
Please enter the serial number for Advanced Data
Management Software into the fields below.
18DF-8EE5
The 18DF-8EE5 and the 0C85-8C66 numbers being different depending on

which drive I launched the installer from suggest that serial numbers are physical media specific.
Does anyone know of a way I can backup the FT-7800 program installer and be able to install it successfully?
any help on this would be appreciated.
Thanks in advance,
Monty KD6CAE

3457. Re: What would cause the SWR to go up drastically when I turn my amp on?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-25 16:45:40 UTC

>----
>Reg
>

Actually they are correct. I ran an experiment using a Barker and
Williamson low pass filter with a 32 MHz cutoff.

With the set-up below the SWR went high when the amp was turned on.

RADIO===>AMP===>SWR METER====>ANTENNA

With the set-up below the SWR stayed at 1.1:1 with and without the amp
on.

RADIO===>AMP===>LOW PASS FILTER===>SWR METER===>ANTENNA

Also the output of the amp showed about 110 watts without the low pass
filter, but with the low pass filter the watt meter installed after
the low pass filter showed about 75 watts. That means about 30 watts
was being transmitted above 30 MHz even through the fundamental was at
28 MHz.

I doubled the value of the capacitors going form the collector to
ground, and the SWR dropped to 1.5:1 with the amp on and 1.1:1 with
the amp off. Then I add 470 pf capacitors from the trasnsitor base to
ground and the SWR with the amp dropped to 1.3:1 with the amp on.
With the TVI filter in-line the SWR is 1.1:1 with and without the amp
on.

A lack of working space inside the amp case made it difficult to
install a pi-network on the input and output side of the transistor
finals.

Thanks for everyone's help. The SWR increased was caused by harmonics
above the fundamental frequency, and they were outside the bandwidth
of the antenna.

John-

Perhaps I don't know my own strength, but it was all I could do to lift
the generator to put it back in the box. I've been starting machines with
recoil starters for 50 years, and this the first time one broke!

The spots that should have been welded were clean. There was no sign of
metal deformation either from being welded or from being torn. The
question is, what held it together for the first few starts?

Isn't that 5% of FULL SCALE?
And with the highly nonlinear scale, the thing can be WAY off in the
middle. I've never had two bird slugs that read the same at half scale.

3467. Re: Ten-Tec Pegasus info wanted

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-26 04:09:46 UTC
From: WD=?ISO-8859-1?B?2A==?=HCO <wd0hco@ev1.net>
Message-ID: <BF0B21BA.1340%wd0hco@ev1.net>
Source record: 14440

I got one and will be happy to comment...

>>> Looking for info also on this radio's Bandpass abilities. Rejecting very
>>> strong RF on other band. BC band overload ?? rejection ability. Ham band
>>> overload ??

Ham band and General RF Rejection is quite good. I have one local who is
about 1/2 mile from me. When I operate on 40m CW he can be 600 cycles above
or below me and I won't hear him and he's not blocking my RX.

CON - BC Band Rejection is bad. My only ant is a 150' long wire about 30'
up. Unfortunately for me I have a 50 KW AM about 7 miles from my house and
two other AM stations about 12 miles. I can hear them when I go below the BC
band. Only thing down there is AERO Beacons. I can only pick up AM BC below
the BC band - 160 meters and above is clean.

>>> Also, does anyone know if the optional keypad/rotorary dial thing can still
>>> be bought ??

I highly recommend it as tuning via keyboard is a real pain and YES Ten-Tec
still sells them.

My other comments:

(1) You need at least a 30 amp power supply with this rig. I had a Astron
20A and blew it up. Now using a Astron 50 amp supply. Ten-Tec tech sez this
is 80% of all problem calls are caused by using too small a supply.

(2) Outside antenna should be at least 20 to 50 feet away from the radio.
Don't stick a wire on the SO-238 in back of the PEG and expect it to work.
You'll be picking up nothing but computer and monitor noise.

(3) Computer Speed doesn't matter. I have used '386 '486 P1 P2 and P3
computers running Windows 95, 98 and NT. Performance is exactly the same.
You would expect this since the link is 56K serial. This is the bottle neck.
Getting a faster computer buys you nothing. UNLESS you want to use the radio
while doing something else. Like using the Internet or CHAT. Then it makes a
difference. After getting tired of getting infected with virus and spy-ware
and re-installing Windows a million times - I now have a computer dedicated
just to the PEG - setup exactly the way I want. It's not connect to the
Internet or anything.

(4) SSB always gets great reports. But few people know CW has a perfect tone
and the AM sounds damn good. Ten Tec makes good sounding equipment.

(5) SHORTWAVE is excellent - I have about 23 SW receivers and I hate to
admit it but my Peg beats them all including a Watkins-Johnson. Very
sensitive and yet has a high dynamic range. Widest filter is 8 KC. Would

have been nice if you could go wider say 15 KC for local BC stations.

(6) CON - No doubt about it - it takes some getting use to. Usually about 4 to 6 weeks - then you will NEVER want to go back to knobs. Most people give up long before that. Give the rig a month and a half before you decide.

(7) MOST IMPORTANT - Why Ten Tec didn't sell this point I will never know.

This radio is the most reliable ever built. Why you say ? It has no knobs - pushbuttons, lamps or switches. These things cause 90% of all problems on other radios. Dirty pot or bandswitch? Burned out lamp? Busted switch?

NOT ON THIS RIG !!! The power switch is the only moving part on this radio.

The PEG consists of 3 circuit boards - each with about 5 or 10 parts - everything else is software on the chip.

Unless the radio is hit by lightning it should stay operating maintenance free for the next 20 or 30 years.

Like I said - I like mine but it takes some getting used to....

Thanks for sharing your results with the rest of us. That's a good experiment you described. The only "final clincher" would be if you had a receiver that covered the spectrum where you might find out what the spurious signal was that was being generated. Most power transistor circuits I've seen have all kinds of weird bypassing, ferrite beads on power-carrying lines, funny adjustable variable capacitors in funny places in the circuit. Good luck otherwise.

Hi again all,

It looks like I'm going to get a Butternut HF9VX vertical to replace my 25 year old Hustler 5BTV. I looked at Gap verticals, but in all the pictures I've seen, they seem to have some kind of horizontal array at the bottom. I plan on ground mounting this thing, and I'm afraid someone will trip on the array and destroy it. My old Hustler had no horizontal elements at ground level, and in all the pics I've seen of the Butternut verticals, it looks like there is nothing sticking out at the bottom either. Is there anything at the bottom of the Butternuts, and what's your experience with them ???

Ron,

I have had Butternuts for almost 20 years. My first HF6v cost me about $150. But times have changed. I really swear by my HF9V. I've earned both DXCC and WAS on a hundred watts.

You will need to bury some ground radials to get the most out of it. I have used it with only a pair of 6' ground rods driven into the ground. But this is certainly a compromise. My current setup has about 8 ground radials of various lengths from about 15 feet to 60 feet, depending on the rocks in the yard.

The attached link shows the VSWR plot of the antenna across the HF Spectrum: http://home.comcast.net/~k1rdm/projects.htm . I would recommend using an antenna analyzer like the MFJ 259 to help tune it.

Good luck, I'm sure you will be happy with it.

Not sure what you mean by a "reflector" or "MOD," but
http://batboard.batlabs.com is often very helpful with many types of
Motorola gear.

To access at least part of the information you describe (part
number lookup) requires an account with Motorola Online. You need to
apply directly to Motorola to get this. 1-800-422-4210.

If it's just a couple of numbers, E-mail me at the human-readable
address shown below, and I'll see what I can do (I have a reseller
account).

Keep the peace(es).

Hi, as Rick said, the 9 is a GREAT antenna. Also, NO traps to mess with.
Traps can be problems!! Just tune it right and borrow an MFJ antenna
analyzer.
It makes the job so much easier.
Good luck and 73....

I agree with spamtank about adding ground radials. My 5BTV has 72 ground
radials and it really does perform well. Pics of the installation here.

1. http://www.ad5th.com/5-BTV.html

Ground return currents are the "other half" of any vertical antenna. Grab
an extra 20db by adding lots of them. Mine total around 1300 ft or wire.

Ron,

My HF6V is nearly 25 years old and still working. It's
really showing its age, and I'm planning to replace it
with an HF9V later this year. They're not cheap, and
they're not easy to tune, but once you have them tuned
properly, they're the best performing verticals on the
market.

Butternut antennas do not have any horizontal components
like many of their competitors' antennas have. You will
need a good array of radials, however. Look up their web
site and read some of the technical explanations on how
and why vertical antennas do and don't work. It will be
an eye-opening experience.

No matter whose antenna you end up buying, I suggest that
you install stainless steel hardware right from the start,
rather than using the zinc-plated hardware that comes
with the antenna. It won't cost much, and it will save
you the trouble later.

73,
Dean K5DH

Source record: 14363

Murray,

SWC-3 covers 1.8 to 54 MHz. The big difference is that in the 1.8-30 MHz it will handle 1000W AM/FM vice 200W for the SWC-1.

Alan

I have been asked by the wife of a club member to clear out the basement.
The HAM was a Motorola enthusiast. Is this the best group for selling the
stuff?

Well here is the first item. I have a remote control console manual for p/n
T1391AM - T1398AM series.

Does this have any value or should I chuck it in the waste management bin?

3503. Questions on Kenwood TS-7850 - PL module.

Newsgroup: rec.radio.amateur.equipment
Date: 2005-07-28 15:47:58 UTC
From: "J. Teske" <jdteske@comcast.net>
Message-ID: <c5nhe19gk991hieh03qdbokucd4844euoh@4ax.com>
Source record: 14376

I have an old Kenwood TS-7850 2 meter base/mobile...vintage mid 80's.
It does not have PL tone module installed and the manual says that
there are terminals inside and a front panel switch so that a third
party PL module can be installed (only three solder joints). Kenwood
says that they do not make one (at least not at the time).

Does anyone know what might be a suitable 3rd party PL module for this
older rig and where it might be obtained. I have heard of a ComSpec
SS-32, but a net search hasn't found how they are obtainable.

For retaining memory, this unit uses 4 AA nicads. They will hold
memory for about 3-4 day according to the manual. If you keep the
power supply on (not desireable) the batteries will remain charged,
but Kenwood also had the provision for a "wall wart" trickle charger
to keep the batteries charged with out using the main 12v power
source. Kenwood made a module called a BC-1 for this function.
I am also trying to source this item.

One word of caution. After using it for months my child bride found the impedence of her Butternut had changed after a hard rain and readjusted her tuner to compensate. A tad later she found a weak station she wanted to contact and turned on her amplifier. A few moments into the QSO the SWR went nuts and she fried a final. Dropping power she found that the tuner settings were again back to normal. We continued to use the 'nut for several weeks then sold it without the problem reoccuring.

I can only guess that the capacitors on the 'nut had filled with rain, changing the antenna impedence, then dried out when a KW was applied. YMMV

Message-ID: <JSaGe.5419$d02.715104@news20.bellglobal.com>
Source record: 14382

I have nice solid state 760ch VHF 118-137mhz AM, 10w base station transceiver with operator's manual. Model is PAE 5610 with clear crisp audio, red frequency digital display and ext-speaker jack. Has built in speaker. New factory mic. Power supply is a RPS1012MB with DC/VOLTS-AMPS readout and variable voltage and dual output. Reads 9 w output.

Fully tested and tuned... in mint condition in and out. Pictures available

User manual included.
Paid $3000.00, will sell at best offer. PayPal accepted.

Proper FCC/DOC licensing is required before using the transmitter.

Please e-mail: eastern.ontario.consignment@gmail.com

agreed, but the manufacturers also state duty cycle along with the specs.
the less time it is on the more power it can put out safely. but I bet with
a big enough blower, the right high voltage and operating current it could
almost do anything. but I was originally stating the ssb and cw modes which
is the norm, you can tell by tuning the bands and hear how many stations are
running rtty when there is no 'rtty contest'. John

Message-ID: <dccrak$1r7c$1@biggoron.nerim.net>
Source record: 14388

Thanks for your help Bob, a CR2016 should be visible on the back of the control unit. But it is just not there. I guess the previous owner took it away. And now I am not sure where and how (there is no battery holder) to put it back.
I will have to use another TX for my echolink station as I don't want it to restart on a wrong frequency in case of power failure.

Thanks again,
73, Pascal f5poe.

You DID NOT state CW and SSB and that's why I replied. If you had, I wouldn't have bothered.

Great info. Thanks

Its not likely i can try one for 4-6 weeks and decide then. hi hi.

Its part of a trade deal.

As far as the BC overload problem you mentioned, i'm even closer to BC transmitters and TV and FM Broadcast transmitters. Less than 2,500 ft.

And the comment about having the antenna 20-50 feet away from the radio.

I use a fullwave 75 meter loop and is feed by ladderline to a roller inductor tuner.

I use to have all those problems you mentioned. The noise from the computer and the monitor.

All of those problems went away when i used my HP laptop and an external LCD monitor.

My current desktop computer is clean too. It also uses a LCD monitor.

The CRT monitors are terrible for sheilding. I don't even use a CRT for anything anymore. Well, maybe a TV. hi hi. And that will be replaced with a LCD very soon.

As far as the overload on the BC band- i can live with that. Just as long as the BC overload isn't
being produced on any of the ham bands. From what i read on you comments pro & con, it appears that BC RFI isn't an issue on any of the ham band. That's great to hear.

Too bad about the narrow AM filter. At least its not as narrow as my FT-902DM HF rig. Its like 6KHZ i think. Not very good at listening to AM. But the only AM i really listen to much is on 10 meters (29.000 - 29.100).

No problem on the power supply here. Its a 40 amp continous ability. Although 30 amps seems a bit high for a 100 watt output transmitter.

The Ten-Tec Pegasus (model 550) will be a back-up HF rig most of the time.
Unless i find out it works better than my main rig. FT-902DM hi hi

Thank you very much for the report and comments. I'm getting closer now on deciding on the Pegasus.

73

I got one and will be happy to comment...

>>> Looking for info also on this radio's Bandpass abilities. Rejecting very
>>> strong RF on other band. BC band overload ?? rejection ability. Ham band
>>> overload ??

Ham band and General RF Rejection is quite good. I have one local who is about 1/2 mile from me. When I operate on 40m CW he can be 600 cycles above or below me and I won't hear him and he's not blocking my RX.

CON - BC Band Rejection is bad. My only ant is a 150' long wire about 30' up. Unfortunately for me I have a 50 KW AM about 7 miles from my house and two other AM stations about 12 miles. I can hear them when I go below the BC band. Only thing down there is AERO Beacons. I can only pick up AM BC below the BC band - 160 meters and above is clean.

>>> Also, does anyone know if the optional keypad/rotorary dial thing can still
>>> be bought ??

I highly recommend it as tuning via keyboard is a real pain and YES Ten-Tec still sells them.

My other comments:

(1) You need at least a 30 amp power supply with this rig. I had a Astron 20A and blew it up. Now using a Astron 50 amp supply. Ten-Tec tech sez this is 80% of all problem calls are caused by using too small a supply.

(2) Outside antenna should be at least 20 to 50 feet away from the radio. Don't stick a wire on the SO-238 in back of the PEG and expect it to work. You'll be picking up nothing but computer and monitor noise.

(3) Computer Speed doesn't matter. I have used '386 '486 P1 P2 and P3 computers running Windows 95, 98 and NT. Performance is exactly the same. You would expect this since the link is 56K serial. This is the bottle neck. Getting a faster computer buys you nothing. UNLESS you want to use the radio while doing something else. Like using the Internet or CHAT. Then it makes a difference. After getting tired of getting infected with virus and spy-ware and re-installing Windows a million times - I now have a computer dedicated just to the PEG - setup exactly the way I want. It's not connect to the Internet or anything.

(4) SSB always gets great reports. But few people know CW has a perfect tone and the AM sounds damn good. Ten Tec makes good sounding equipment.

(5) SHORTWAVE is excellent - I have about 23 SW receivers and I hate to admit it but my Peg beats them all including a Watkins-Johnson. Very sensitive and yet has a high dynamic range. Widest filter is 8 KC. Would have been nice if you could go wider say 15 KC for local BC stations.

(6) CON - No doubt about it - it takes some getting use to. Usually about 4 to 6 weeks - then you will NEVER want to go back to knobs. Most people give up long before that. Give the rig a month and a half before you decide.

(7) MOST IMPORTANT - Why Ten Tec didn't sell this point I will never know.

This radio is the most reliable ever built. Why you say ? It has no knobs - pushbuttons, lamps or switches. These things cause 90% of all problems on other radios. Dirty pot or bandswitch? Burned out lamp? Busted switch?

NOT ON THIS RIG !!! The power switch is the only moving part on this radio.

The PEG consists of 3 circuit boards - each with about 5 or 10 parts -
everything else is software on the chip.

Unless the radio is hit by lightning it should stay operating maintenance
free for the next 20 or 30 years.

Like I said - I like mine but it takes some getting used to....

Hi Ed,

Yes an actual cabinet for a 51S-1 is hard and expensive to find.
However a KWM-2 case can be modified buy opening up part of the back.
You can also find a rack mount that would also work. The other choice
is to make a rack mount by cutting out the proper size hole for the trim
ring. I bet it won't receive any better in any of the mountings.

Thanks Larry. Went on EBay, found a KWM-2 cabinet for sale, bid, and won it. Should be arriving next week. Apparently I was quite fortunate to find that listing. There don't seem to be many offered, lately.

Source record: 14303

I am a very casual user. I spend a great deal of time at the computer
and the Pegasus is easy to keep out of the way, it sets on a high
shelf above the computer, no desk space required. I am powering it
with the 45 Amp MFJ supply. I also have the optional automatic tuner.
The antenna is a Cushcraft A3S beam on a crank up tower. It usually is
left at about 25 feet to minimizes the threat of foul weather. With
this setup I can move into ham mode from computer mode in as long as
it takes to plug in the beam & rotor. I never had it this easy before.
Besides that, it has more features than I can imagine using. I suppose
most of the modern gear has the multiple filters and band scan
displays and such. I suppose they also let you set the band limits
according to your liscense class and provide a visual scan of whatever
band segment you choose.
I usually use the control software that N4PY sold up to the point
where he started copy protection. I change computers pretty often and
the copy protection is just one problem too many for me!

I have been watching for another one on hoping for a bargain to
install in the Winnibago as a mobile rig, but so far they seem to be
retty scarce. The current owners must like the rig as much as me.
Since I already have a laptop mounted for GPS navigation, it would not
take any panel space.

And there is the condition that if you think you have a problem,
TenTec has been really good about answering my dumb questions!

I do have the remote knob accessory, but I have not found it useful.
My hands know the keyboard better.

As one fellow pointed out to me after I admitted that my last new rig
was a Yaesu FT-301 I would be thrilled with any modern rig!

Any one interested in a couple of old FT301's? I don't think I can go
back!

Hi
I need a Motorola Syntor X Cable
Also a plus if you can put tags on wires for PTT/TX audio out/All
Positives and grounds also tagged. Will not be used for receive
audio.
Going to use the cable on a VHF Syntor X for PTT and audio out only
for
a repeater.
Please leave price and phone number.
Thanks,Rich

Hi,

I need informations on old radio system based on galena stone.
Is there anyone on this newsgroup that is specialist in this or is there anyone that can route me on another newsgroup more appropriate or any community ?

Thanks for answers

I think you are speaking of galena crystals that were used in crystal radio
receivers.
The junction with the galena crystal rectified rf signals that were
amplitude modulated, producing
an audio output directly to headphones or an amplifier.
Ed

Don't know if a newsgroup specifically dedicated to galena crystal/cat's whisker, but these links
should be useful:

Yes exactly, In fact I'm French and I didn't know before your response
the exact term. Thanks for that.
Somebody told me that the wire directly in contact with the galena
cristal must be in bronze. I would like to know if someone could confirm
this and if it's correct I should be very interested to know where I
can find some.

Yeah galena xtals used to sell in wolworth dime stores for about a dime way back when I was a kid. Doubt if you could find one anywhere in the world at this late date. My first hombrew receiver consisted of a large coil wound on a round oatmeal box, a galena crystal as detector, an old pair of WW1 headsets that weighed about 10 lbs, and a homebrew slider on the coil so could peak the am broadcast signals. First you had to use a needle point on the galena crystal to find a hot spot where the signals produced the max signal, and then you were all set to lay back and enjoy your local Radio stations.

Thanks for your precisions. I have exactly all parts you have explained.
It's was made and used by my grandfather in 1920 and my father give it
to me recently.

I remember when I was ten years old, one day I discover this receiver
and we (with my father) deployed wire for antenna in the garden and used
it. It was for me fantastic to hear radio without energies from
batteries or anything else.
Now I have for children and I would like to use it again, perhaps the
older one will be as interested as I was.

I know we have lost the needle (to use your terms) and I used in the
past a copper wire to replace this part.
I think it's not the better choice and expect somebody to recommend me
what kind of metal I must use.

As I'm French I don't really know the exact technical English terms of
the different parts used in this receiver.
If necessary I can take some pictures to precise the model I have.

Once more, thanks for all responses.

Kris

For sale: MFJ-564 chrome paddles with red finger pieces.

Includes box, packaging & adjustment wrench. 3 months
old. Nothing wrong with them - It's just that I just won a
1954 E.F. Johnson bug on eBay.

New price for the MFJ-564 is $59.95.

Asking $34.95 plus $6.50 for shipping. Payment via US
postal money order to my QRZ.com address. OBO!

I'm looking for a MFJ 2 position coax switch. Send me that
and a twenty dollar bill and I'll ship you the paddles for free.

snip

Just cut the point off a safety pin maybe aboue half inch long and
somehow braze or solder a wire to the pin. In fact though
it has to to gently press into the galena so a slight springiness
is required.

I have 4 Bird Slugs for sale that are not working. They are:
2-100C's/ 100 Watts for 100-250 MHz
2-100H's/ 100 Watts for 2-30 MHz
They look good, except one of the 100H's has been disasseembled.
They don't show any reading on my Bird 43 Wattmeter.
I know that these can be repaired, but I am not up to it.
I am asking $45 for for the lot, shipped in the lower 48.
Thanks, Charlie Hugg, K5MBX

If memory still serves me, I'm pretty sure that it will.... although it may take a special "ham" version of the Motorola software, along with the X9000 interface cable and a RIB. There are second party vendors with programming software/hardware too.

Don't forget to check out info on this subject at

> and its on 150-170MHz Will it go on 144-148MHz easy??

FWIW: The 'T99X...' string of characters is not the radio's model number. The field under 'ID' is. What happened is that Motorola got a bunch of bum labels at one time. Rather than replace them, which would have been costly, they simply ran with it, figuring that field techs would be smart enough to know the difference.

Now, with that said: In order to even test that radio, you will need an appropriate Syntor X9000 control head, mic, speaker, AND control cable. NEVER connect an X9000 series radio to a standard Syntor control head group! Magic smoke will be released.

As to the question of ham bands: The answer is 'maybe.' What is required is that the receiver's RF deck be sweep-tuned, using a spectrum analyzer/tracking generator combo OR an RF network analyzer, to accommodate the 2m band. This is a tricky process that takes about an hour to do properly (I know... I've done several).

Following the retuning, you will need to program the radio using the appropriate software (no longer available from Motorola, as a special 'ham' version was required to do ham frequencies), a RIB (Radio Interface Box, about $100 or so if you buy one used), and the appropriate programming cable (about another $50).

You will also, to use the software, require an old computer, no faster than a 486/33, running TRUE MS-DOS. You cannot use a "DOS Window" on a Windows system. It Just Won't Work. The preferred platform is a 386/16 or /33. You can often find such older systems at used-computer places for cheap.

Intimidated yet? ;-) If all the above sounds like too much and too expensive, I would be happy to do the conversion for you. It'd probably run about $50-$60 in labor, assuming there's nothing else wrong with the radio, and assuming you have all the accessories (the control head and radio make up a matched pair).

Details are available at http://www.bluefeathertech.com/rf.html

Happy hunting.

All,

I've been listening to this guy on 80/40m with his 60m high antenna, he's a huge signal with me and indeed crashed over the top of the pileups for the PY's on 40m the other evening, now I see he is selling them.

Might be worth a look if you have a small garden as it would appear it works fine from this type of QTH.

If the TM-V7A has an LCD display, there could be contamination on the rubberized conductors which mate the LCD to the PC board. The cure is to carefully remove and clean the conductor and PC board with alcohol.

Hello, I am currently a comp sci student who has become interested in ham radio, mainly from taking physics classes and learning about electromagentic theory. I find the subject fascinating and would like to learn more theory and hands on applications. Currently my schedule doesn't let me take any of the classes which sound interseting like EM wave theory and antenna theory. I go to a small school and there isn't a ham radio club here.

>From my initial research into ham radio, the subjects which I have the most interest is mainly satellite communications, but I am also interested in DX communications, antenna theory and packet radio.

I have found three clubs on the ARRL website within 30 miles of me. Only one of those lists DX communication and none of them list satellite or packet radio as one of the groups interests. I feel a little uneasy simply showing up to one of the meetings with my limited (read non-existant) knowledge of the subject. I know enough about the physics and theory behind everything, but pratically 0 about the actual application. I envision going to one of these meetings (the one closest to me is held at a diner) and sitting around a table with a bunch of guys who are talking ham radio jargon and not being able to follow anything being said. I realize they are probably helpful to newcomers, but I think they would expect a newcomer to be able to hold their own, which at the moment I would be unable to do

Is there any (cheap) equipiment or kits that I might be able to find on ebay or some retail outlet that you could recommend to a beginner which I could play around with to help me get started before being licensed?

Any books or websites geared towards beginners (possibly with my interests in mind) that I might find useful? I've found a bunch, but it would be better if I could get some recommendations from experienced operators.

You are really over-thinking this. Just pick a club and go. They will be very glad to have you show up, and won't expect you to know anything about anything. It's not like a school classroom. Just a bunch of people getting together with a common interest. Usually there will be some kind of program for the meeting that will be of interest to you and anyone else in attendance. My wife goes to our radio meetings, and trust me, she doesn't know the first thing about ham radio. I take that back. She does know my call letters. :-)

Charles,
Attend a meeting, introduce yourself and tell them your interests.
Get a feel for the members and what they are doing. Typically, there
are hams who are involved in various aspects of the hobby. You may be
presently surprised. Start at the top with the Club's President or if
he/she turns out to be non responsive find someone who is.

Just my opinion for a "first step". Of course read up as much as you
can. The jargon, by the way, will come as you get more involved.
Good luck.

A bit expensive unless you buy a used one, but you might purchase the ARRL Handbook, which contains hundreds of pages of useful information about most aspects of ham radio. Both new and old copies of this book can be purchased through Amazon.com.

Thanks for the advice, I will attend a meeting. After further
searching the ARRL website, I found that my school is actually
conducting a test on Sept. 24th to get a technician's license! I will
have time to attend one or two meetings before then and I also found
the ARRL book Now You're Talking and the hadnbook at my schools
library. Hopefully this should prepare me enough for the test.

On another note, I am working part-time while at college so money is a
little tight. So I can get an idea of what I need to save, how much
should I expect to spend on a beginner's rig? Any advice on a model or
make that would be a good starter set? What if I want to do some
sattelite communications?

Thanks again for the advice,
Charles

Charles,

Clubs vary - from my experience, the majority are very open, friendly, and helpful to newcomers and would-be hams.
Unfortunately, to be totally honest, some are cliquish and not like the majority.

I would suggest you vist all three and see which one "feels best" in terms of openness, interests of the membership, etc. and decide from there.

Ham radio is supposed to be about "Elmering" (experienced hams welcoming and helping newcomers), so don't feel like you need to go it on your own until you've "earned your stripes" ... if you visit a club and don't get an appropriately warm welcome, move on and try another one.

73 and good luck,
Carl - wk3c

Glad you found the book - read it and you should be able to make inroads into a licence. I'll say, just to reinforce it - go to the club! There's bound to be one or more who'll point you in the right direction when you need some help.

Take a look at Ebay for prices of rigs - search on 'amateur radio' (duh! wasn't my first pick but it's pretty durn obvious :-) or the makes, like Yaesu, Icom, etc. Take you pick, depending on band(s) you want to work. Or just drool for a while before you splurge - if you wait a while you'll find you'll have a better idea of what you want to do. You guys are spoilt for choice in North America. :-)

For satellite, and I'm talking from a position of not having done it for a few years (I have to do it at work so I tend not to at home now) so someone correct me if I'm wrong; look at a 70cm and a 2m rig or a 70cm/2m dual-bander. But if the cost is beyond you at the moment, get one rig and play with it and figure out procedures, antennas and the like. Plenty to play at before moving on!

Have fun!

Cheers.

Ken

Make sure that the Now You're Talking book is the latest issue so that
you're studying the right stuff. Although I'm not sure how much it's
changed. An older issue may be close enough. Anyone know?

Charles,

OMG, please don't count on any of these groups if you want to get an idea of what amateur radio is like. Go to the club like these guys suggested. Do some research online (arrl.org, etc.) and go to the library if you can, and go to HRO on a Saturday morning if it is close by. Hams are, by nature, good people, and they will be glad to help you!

But r.r.a.m and other such groups are not good indicators of what ham radio is like. These newsgroups are the "short bus" full of ham radio wannabees. There are many, many good resources here as well, but the dozens of idiots screaming from the short bus drown out the few intelligent ones.

You will get insulted here (as will my posting... watch). That is not what ham radio is about. Don't let it bother you (and in fact, don't even read the rest of the sentence when they spray paint you with their grafitti.)

Just go ahead and get on the air and you will have more fun than you can imagine. Trust me - I have been on the air since 8th grade. I turned 50 years old in Feb 2005.

And go ahead and post here, but remember that amidst the 90% jerk factor here, you may find people who actually are licensed, and among them, you may find some who get on the air sometimes, and among them, you might find someone who can do you good.

All the best, and 73,
Dave

Did anyone mention the www.arrl.org page and AMSAT for the sats ?

Look around and see if there is a hamfest near you. That is a flea market
for ham gear. You may find a used rig there. As always you may find a few
that will sell a rig that is not working like it should and so on.

While studying for the license test don't try to learn anything from the
qustion and answers, Just study the correct answers. Get a ARRL Handbook ,
even a used one a few years old will go a long way in getting you started on
teh correct path. Packet is just about dead except maybe a few that are
looking at the DX clusters.

Thank you all for the advice. It has been very helpful and given me quite a few pointers. The book that I have is the 5th edition and I believe it is the latest. Thanks for the warning about the newsgroup. I noticed some flames and other pointless rants, it's good to know that there are people intelligent enough out there to see what it is and simply ignore it.

I'll check out ebay and keep an eye out for the brands you named. I'm not sure if there are any hamfests around here, but there is a huge flea market every Saturday, so I might stop by there and see if I can get any information there.

I'm also glad to hear what everyone had to say about the clubs. I will still check them out, but it's good to have the info you provided. I had a few experiences with some computer user groups that claim to be open and welcome to new users but can be almost snobbish to a beginner.

This seems like a great way to get my hands on some fun gear to play around with and meet some interesting people. I'm excited to try it out! Thanks again for all the advice and anything else you might think of is greatly appreciated.

Charles

You don't EM or antenna theory classes to join this hobby. They may
certainly enhance your fun later, but I've taught classes at the local
community college and graduated (licensed) dozens of folks that didn't
have any electronics education.

>
>>From my initial research into ham radio, the subjects which I have the

My satellite experiences ended with Oscar 6, a long time ago, so I
can't comment on the current bird activity and/or operating modes.
AMSAT is the organization that you need to look to for this stuff.

Casual, as opposed to rabid DXing is an interest of mine, but frankly
with the current state of the sunspot cycle this isn't as much fun as
it will be in a few years. You're a young guy so you will have
several cycles to look forward to.

I've never had an interest in digital modes, but I think packet is
pretty much over with. The new modes are PSK-31, etc. Some vhfer's
are using digital modes for meteor scatter and moonbounce. See:
http://pulsar.princeton.edu/~joe/K1JT/index.htm for a start.

To be honest, at least in my area, clubs are populated by a bunch of old geezers like me who are more interested in socializing than programs. That said, by all means visit them and make your interests known. These guys won't bite (many of them don't have their teeth anymore) and they put their pants on the same way as you do, one leg at a time.

In all likelyhood, if they have any sense, they will welcome you with open arms; young people interested in ham radio being a rarity these days.

>
>Is there any (cheap) equipiment or kits that I might be able to find on

Check out the clubs first. You might find someone willing to loan, or give you an older rig, just because you're interested and he has one he doesn't know what to do with anyway. I have done this.

Besides, being cheap and a scrounger is a ham tradition; you might as well master this aspect at an early age. Begging is perfectly acceptable.

Of course the ARRL site www.arr.org is a place to start. The aforementioned www.amsat.org has a "New to satellites" area.

Welcome to the fold,

Wes N7WS

Consider buying a low cost used scanning receiver that will let you listen in on the segments of the VHF and UHF amateur bands where you'll find most of the FM repeater traffic (roughly 145 - 148 and 440 - 450 Mhz). Personally I'm a fan of Uniden's BC895XLT or the newer BC898T. These $200 receivers (new, $125 used) make great general coverage receivers for the VHF and above ham bands. Google on the model numbers.

Also consider a used dual band 2 meter / UHF trasceiver for about the same price.

If you live anywhere near a city with a good sized ham population you should hear daily traffic on the repeater systems. For information on specific Philadelphia and Pennsylvania area repeaters see this link:

http://www.artscipub.com/repeaters/states/Pennsylvania.asp

Good luck and welcome to the world of amateur radio.

<snip>

This would be a good question for the gang at:

http://radio.the161.net

They have a forum specifically for GE/Ericsson/M-A/com radios.

I do know that the MR-K's came in all standard land/mobile bands
(VHF-HI, UHF, 800, 900), that they could handle EDACS trunking, and that
the VHF and UHF models, at least, are convertible for amateur use.

Happy hunting.

Silent Key Auction for Herb Petereit, W0AFY. If you knew Herb, you knew that he was one of the "old timers". One of his first jobs after moving to Omaha, Nebraska, in the 60's was building Galaxy V's at World Radio. He knew his gear inside and out, knew how everything worked, and took a lot of pride in keeping everything running in top shape. For many HAMS in the Omaha area in the 70's and 80's, Herb was the guy to go to when you needed help.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Cornell Dubilier Ham III/CD-44 eight-wire antenna rotor controller. My dad used this to control the Tail Twister rotor under his 10-element tribander. Some fellow hams in the area purchased the tower with rotor and antennae, but for whatever reason did not take the controller. It's a very clean unit and as far as I know, in perfect working condition.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5796213575

Please be sure to check out the auction listings for other items from my dad's shack. Thanks!

FS: Yaesu FT-8900R quad-band mobile radio. 10m/6m/2m/70c
Box/manual Looks and works like new. Built in Quadplexer.
The knob on the left side broke off. The inner knob still raises
the squelch and volume,So I never replaced it. I still have the
knob to go with it. Everything still works fine and it certainly is
not beat up.
Looks NEW! I'm a non smoker. Comes with the original box and the
Touch-Tone Microphone, Model MH-48
Price: 295.00

Try the newsgroup, rec.radio.amateur.antenna

Several crusty elec. engineers, book authors and other knowledgeable
types discuss all manner of wave theory and antenna theory there. It's
free, and you can learn a lot, whether you simply observe or get
involved. They can also point you toward many of the classic books
from long ago on antenna theory.

3622. Strange object : what is it???

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-08 15:46:07 UTC
From: Rightrik <gaggiorNOSPAM@tin.it>
Message-ID: <3lpd23F13lnoaU1@individual.net>
Source record: 14295

Hello, i have a strange surplus (???) object to understand...

It is a metallic container, sealed, with a "BNC" female on the left and a
"N" female on the right.

Size is 11,5 x 5 x 7,5 centimeters.

On the top i can read this :

FCC-550-230-75-NB1
FSCM: 53779
DATE CODE: 8912
S/N 337

A photo here :

http://www.arifidenza.it/Public/data/ik5wqo/200587224338_piccola.jpg

It should be a sourge arrestor, but i need the exact specifications.
Can this be useful for an amateur radio station or it is completely useless?

Thank you,,
73 de Riccardo IK5WQO

I suspect you are correct in that it is an old transient supression device. I don't know what you would use it for in amateur radio, but you might try to contact Fisher Custom communications. They are in Torrance, California, USA.

Contact Info on the site at: http://www.fischercc.com/transframe.html

It also might be a pass filter, seeing that it has no grounding point.

Hello Bob,
well there is a "maybe" grounding point on the BNC connector side .
There is a big screw on the connector himself with a big washer, is suppose
it's the grounding point.

Ok, BUT, to be a good suppressor, the grounding point would NOT be close
to the signal in/out.

Silent Key Auction for Herb Petereit, W0AFY. If you knew Herb, you knew that he was one of the "old timers". One of his first jobs after moving to Omaha, Nebraska, in the 60's was building Galaxy V's at World Radio. He knew his gear inside and out, knew how everything worked, and took a lot of pride in keeping everything running in top shape. For many HAMS in the Omaha area in the 70's and 80's, Herb was the guy to go to when you needed help.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Icom IC-211 VHF transceiver. This rig covers 144.00 thru 148.000mhz. It has the built in A/C power supply but can also work off DC. Power out is: SSB, 10 watts, CW, 10 watts, FM 1 to 10 watts. Controls include: mic. Gain, RF power, power SW., squelch, AF gain, mode SW., RF gain, VFO, RIT, NB, AGC, rec/transmit, vox, dim switch, tuning, tuning speed button, dial lock, freq. display, rec. indicator, dial lock indicator, trans. ind, discriminator meter, multi-func. meter. The back has jacks for a scope, ext. spkr., dc input, memory sw., acc. jack, key jack.
I plugged in an A/C cord and it powers up with the meters and LED's illuminated. Being that it was my dad's, it's a pretty good bet that it's in good working condition.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5797089435

Please be sure to check out the auction listings for other items from my dad's shack. Thanks!

He knew his gear inside and out, knew how everything worked, and took a lot of pride in keeping everything running in top shape. For many HAMS in the Omaha area in the 70's and 80's, Herb was the guy to go to when you needed help.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Icom IC-2100H VHF Transceiver. This was my dad's main mobile unit that he used when he was storm spotting. There are minor scratches that are to be expected with a mobile unit, but none on the controls or the screen (the microphone actually looks like it's never been used). It's a very clean unit and as far as I know, in perfect working condition. Power and antenna leads are included.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5797081779

Please be sure to check out the auction listings for other items from my dad's shack. Thanks!

I have a Kenwood TM 701 that has good rf decks, audio etc. The
previous owner botched the button cell battery replacement job.
Radio does not program properly. Can only change freqs with the mic
up/down buttons.

I would like to find one that has toasted rf decks (most of them) but
has good logic Or just the front encoder board.
Willing to sell for parts as a last result if I get no answers for
k-ball unit.
Please e-mail to ron@onwisconsin.com

Thank you.

I think if one knows he code is a true amateur radio operator. One never knows when the code will come in handy. Although, I must admit I am very lax on using it. I haven't used it for years, but I am trying to brush to on it. I find it fascinating.

I'll add to that.

True amateur radio operators can build spark gap receivers and
transmitters from scratch using materials they have in their junk boxes.

3642. Re: Removal of Morse Code from Amateur License Requirements...

No matter what any of us think in a "purist" sense, even with code, amateur radio has certainly changed over the decades. I'm a purist in other areas. Like reading books instead of computer screens. And using film along with digital imaging. And I can still do my math in hex. Never practiced it in octal or split octal.

There was a time when a ham almost was certainly so knowledgable about electronics as to be at the EE level of learning. And a *lot* of discrtionary income. Today any bright person can learn the antenna theory and go purchase a set with relative pocket change.

We may have to rethink what's at the basis of Amateur Radio. Is it the fraternity?
Is it the public service? Is it the skill set? Or is it just the frequencies? And how can be best support the art & craft we know, maintain it, and continue as a unique and special medium of communication.

Yes, I'm only a Tech. But observing changing times and making the best and providing direction are important considerations. That makes it more important than ever to let your voice be known to the FCC on these matters. It's just like voting. Be heard and you will be influential.

My personal suggestion:
a) keep code, but 5wpm @ General & 20wpm @ Extra
b) Reallocate 220, 440, & 144 (maybe keep 144)
c) give Tech 6M, and leave the rest the same.

This would provide a lot of practical versatility and keep the CBers out.

Just my 2c,

Collin

The South African situation is:
Morse Code at 5wpm is one of the ways to get an unrestricted licence. Other
ways are logging 100 unique callsigns, building a working transmitter,
logging 50 hours of community service... there's one more that I can't think
of right now.

We have only 3 classes of licence.
The lower one's allows access to 6m and up as well as limited HF. This is where you are If you've not completed one of the abovementined tests.
There are 2 written exams - the more technical one allows higher power.

Is anyone familiar with the adjust mode in the service manual for the
950sdx?

My I.F. VBT is way off. I got to the adjust mode, menu 6 as it
indicates,
get a reading of 90 or so at center-but must go fully clockwise in
order to
pass the cw signal. (230 or so) I cant understand what they mean in
the
manual about "how" to adjust the setting and save it.

It seems gibberish to me.

I cant hear any cw signals through my 500 Hz 8.83 filter unless I move
the
I.F. VBT fully clockwise.

Any help would be appreciated, Please note new email address

Actually, I didn't, and the intent of your post was not at all clear to me,
since you specifically addressed it "To the many without call signs," rather
than to cross-posters or posters originating in other groups.

Well crap if that is all it's good for then lets abandon all the high tech' poo and
go back to the old Semaphore Flag Signaling System. No electrons needed.
LOL or perhaps smoke signals from here to yon.

Welcome to the 21st century.

Hi, all concerned:

Could this be a "-1"-filter-suffix vs " "-filter-suffix problem, ie, differing center frequencies? Eg, the '440 had a YK88CN and the '850 had a YK88CN-1, differing by a half-KHz or so in c-f and having the same b-w.

I got the adjust info from a good hearted Ham......no change.

Does anyone know which V.R. to adjust to center the VBT pot?

I am looking for it in the service manual, but not having much success.

I got a better copy of the schematic. It appears all is digital in the adjustment of this control.

Perhaps I am missing something.

When using 2.7 or 1.8 kHz filters in CW mode, I still have to turn I.F.VBT way to the right to get full strength cw signals.

When I add 500Hz filter, it MUST be within one or two clicks to hear anything...just what I would expect.

Anyone have any ideas or insight as to what my brain is not comprehending here?

All is appreciated.

Mark

3670. FS: Yaesu rapid charger & Soft case

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-11 13:50:28 UTC
From: Ken Bessler <kg0wx@NOSPAMyahoo.com>
Message-ID: <EIIKe.200$ct5.25@fed1read04>
Source record: 14243

I have a mint condition Yaesu NC-50 Dual slot rapid charger
plus two CA-10 Charging inserts. As is, it will rapid charge
the following battery types:

FNB-31 4.8v 600 mah
FNB-33 4.8v 1200 mah
FNB-35 7.2v 900 mah
FNB-38 9.6v 600 mah

FNB-10/12/14/17/40/41/42 batteries are also supported with
the CA-7, 14 or 15 sleeve which is available at HRO (Cheap)

It will also charge Batteries America and W&W NiCd packs. It's
a nice charger! I just don't need it. I also have a Yaesu CSC-66
soft case for the FT-51R in perfect condition.

HRO still carries this charger, probably because it's so versatile.
New price at HRO is $65.00. Asking $27 plus $5 for shipping.

Make me an offer on the soft case.

First come first serve! As with many of my deals, if I get multiple
responses, I'll check the headers to see who was first.

So what? It hasn't been legal to operate a spark transmitter for a
couple generations. You don't even have to be a ham to build, just pick
up some of the early books and follow the instructions. The receivers
of that era would be useless in today's congested RF spectrum, as well.

On the other hand if you can design and build a state of the art
communications system without outside help, that is something to brag
about.

I do wish people would not refer to me as a 'ham'.

Amongst the very few things I am proud of is that I am a true Class-A Radio Amateur.

Incidentally, as a British pensioner, my annual licence is free. When requested I just have to confirm I am still in circulation. Same applies to riding on buses when mobile or not mobile, sober or not sober.

Arn't you American Amateurs envious?

Reg, G4FGQ.

I can't imagine why we should be. I've been a ham for nearly 50 years (Extra class for more than 40) and have never paid a cent for my license (or my commercial FCC licenses, for that matter). Can't recall the last time I rode on a bus. But the 17.5% tax I'll pay on everything I buy in your fine country during an upcoming trip will be my small contribution to your continued enjoyment of your lifestyle. Then I'll return to Oregon, where we have no sales tax and I can ride on the light rail for a couple of hours for a bit under a pound. Even for those of us who aren't pensioners.

Roy Lewallen, W7EL
Ham.

What frequency? The last system I worked on was a 70 MHz IF with a
90 MHz upper limit for a dual channel telemetry receiver with a
diversity combiner all done in the digital domain.. It was the
L3-Com/Microdyne RCB-2000. It also had a 70 MHz IF output that was
regenerated after the FIR filters to feed wideband logging recorders for
later analysis. Multiple IF bandwidths and Video bandwidths. It was
controlled by a custom GUI under embedded NT, and had IEEE-488, RS-232
and Ethernet ports for remote programming and control. All for just
$80,000 per radio.

The DR-2000 was the same basic radio chassis, but it was just single
channel receiver.

I'm old but I don't remember spark gap receivers:)

The problem with amateur radio is we are not generating much interest in the younger set. Go to a HAM swap meet and all you see is us old farts and our grandchildren. Even us HAMS are using the internet to communicate now. We should take this to 40 meters:)

Could this be a problem with technical subjects in general? When we were kids we were interested in photography, radio, model airplanes, cars and so on. Don't see many kids doing that stuff now. Remember the excitement of your first radio contact? I got so excited I couldn't copy the code at all. How about the first contact in Australia or Japan? If you try to tell a youngster about it now, they'll look at you like you're on something. Having an autopatch is not exciting when everyone has a cell phone. Remember calling someone in a distant city and having them patch you through to a relative or friend? Now with three cents a minute long distance and so on it's a different world.

BTW, that was a joke. Being retired, I don't know what the upper
frequency limit is for DSP sampling nowadays. I was using one
million samples per second systems at Intel ten years ago.
They worked well at 455 kHz not only for filtering but for
decoding/detection.

Cecil, I thought you and I did our 'DSP Filtering' by adjusting the
regeneration control or the whisker.

What's an IF ?? IF! If What??

Strangely enough, I never used anything except a superhet.

> What's an IF ??

455 Khz on everything I used back then. With no RF amp,
my S38 would receive the same signal on two different
frequencies on 15m, sometimes eliminating an interferring
signal in the process.

Not the least little bit. All our renewals are free regardless of age or work status except for those who elected to get a vanity call sign of their own choosing instead of sticking with an assigned call.

Then of course there are those of us who had to pay ransom for our
original, assigned call letters because the FCC made us give them up
when moving to another call district, then, when the rules changed,
wouldn't let us have them back without paying for them. Vanity had
nothing whatever to do with it. Still angry over that.

I would have loved to stick with my assigned call when I moved
from TX to CA in 1971 but the FCC forced me to give it up. Now
they have charged me the social security money they gave me to
get it back.

3690. FS: 500W solid state HF amp.....

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-13 03:12:26 UTC
From: MICHAEL LINGER <oldrover@verizon.net>
Message-ID: <uydLe.1070$H_4.643@trnddc07>
Source record: 14164

FS: Solid state Skywalker 500 linear amp with 200amp metered power supply. Puts out over 700 watts on 75M. Amp it 9+ in appearance and 100% in operational quality. Substantially less than 80 watts drives it full power. Also has bandpass filters for all HF bands. It's very quiet and very efficient. $850.

3691. Motorola Micor base station power supply schematic

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-13 03:49:35 UTC
From: DaveM <masondg4499@comcast99.net>
Message-ID: <htmdnTnGyoFS8GDfRVn-2g@comcast.com>
Source record: 14165

I used to work in a Motorola 2-way shop back in the mid 70s. I remember that the early Micor base station power supply was regulated by a SCR phase control regulator. I want to build a power supply modeled around that Micor power supply. . I have most, if not all, of the components to duplicate it, but I have lost the schematic for it.
Does anyone have a copy of the schematic for that vintage Micor base station power supply? I don't need the complete manual, just the PS schematic.
A scan would be great if possible.

Well for myself I wouldn't have picked the spaghetti soup group of letters I had to
start with. But after retiring I thought I might as well get a little vain... That's all
that left after a while. he he.... So for a whopping $20 I got a vanity call after
moving to a new call area. I thought in my second life after heart surgery, back surgery,.ect. I might as well have a little fun. After all isn't that what a
hobby is for? I'll get 10 years out of my new call but I can't get that far on $20 worth of gas these days. eh. Now all I need is about $20K for that new $13,000 ham radio and a tower and antenna ha ha.

What ever is fun is ok. Even if it means dumping a 25 year old call sign.
Let me see Ham radio so varied what next.
Been there done that.... DXCC... RTTY... OSCAR.,.. PACKET...
oh and of coarse RAG CHEW codey slow no problem getting in the time for that award. Contest... Special events... Homebrew...
and a cold brew...

Oh BTW it isn't the one with the most toys... It's the one who gets to play the most with their toys. Have fun everyone and don't take it too seriously or you get an ulcer and high blood pressure.

Cheers 73 ol' WB9SMX new K4TWO when the papers arrive. ;-)

That did kinda suck..... What I liked, was when it used to be a 6 was in 6 land and you knew where they were - within reason. Now, a 6 can be any where and you have no clue until they tell you. Kinda makes it a tad more difficult to do collecting of call areas. You hear that elusive call for a certain state and you jump on it only to find they're in your back yard so to speak. And I have known guys who had calls they favored only to have to lose them by moving as was pointed out by Dick - W6CCD.

I have an ADI AR-147 rig that seems to have a heat related problem.
When I transmit on medium or high power for a few minutes the case
gets very warm and my display acts up. It will show just about
everything ...all gibberish. Sometimes a tap on top of the rig will
get it working and letting the case cool will always get it back.
Might open it up and re-solder or clean the display contacts. Anyone
else have this problem? Thanks ... Scott VE1AFN.>

Ham friend of mine has a Kenwood TS-830S. Works fine on all bands
except the readout/receiver/transmitter intermittently goes out on the
10 Mhz and 21 Mhz bands. More off than on. He has the maintenance
manual but nothing in there about it.

Any guidance/help on what or where to begin looking at would be
appreciated. He is an excellent technician but this one has him
stumped. Thanks.

Hi Everybody

I hope this isn't the wrong place to ask. if it is, please let me know where I should post.

I have a Kenwood TS50 installed on a boat with a SGC autotuner. The tuner is grounded to a dynaplate.

I also have a 2000watt inverter/charger built into the boat for ac power creation from 12v batteries.

Something strange is going on and I jusr don't know where to start trouble shooting.

When I transmit on frequencies like 14300MHZ usb, no problem.

If I transmit on 7628 LSB 100watts the FET's in my inverter blow up! As soon as I key the mike I hear a loud pop and there goes another fet.

I've changed them twice now and since the inverter is bolted into an awkward spot and weighs 70 pounds (it's all transformer), removing the inverter and changing them ain't fun.

Tonight I went so far as to disconnect (as in unplug) the AC supply to the inverter and switch it completely off. As in no LEDS lit, everything off.

Yet as soon as I keyed the mic, POOF. The fets just blew apart.

Any thoughts as to what might be happening?

FWIW, the coax from radio to tuner runs within about 2 feet of the inverter, the radio and tuner are powered from the batteries which power the inverter. So the inverter and radio share Pos. and Neg.

I can only think of a few ways this might be happening:

1) Radiated signal from the coax leaking into the inverter.
2) Radiated signal passing into the inverter via the shared positive or negative feeds.
3) Some weird ground loop issue.

I have no ideas as to how to diagnose this and trouble shoot it without having to replace fets everytime. And that's a big job.

Any thoughts would be greatly appreciated.

3713. Re: Removal of Morse Code from Amateur License Requirements...Vanity call wheeee

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-14 02:50:57 UTC

Though this appeared in the Rec.radio.equipment newsgroup and is being broadcast to several others that may or may not really be appropriate for this diversion from the original subject, I can't help but responding....

When it comes to a vanity call, the relative pittance we are charged for a call that makes sense to us (whether because of an old call in another location, or because it's easier to transmit in morse, or even fits some other plan we may have) is worth the money in my opinion, and I imagine to anyone else that took a vanity call.

For myself, I chose my current call because the people at FCC didn't give me a call in my area on an upgrade from Tech to Extra, despite an address update way prior to the examinations. Somehow, they managed to show correct postal box address and city, but my state as California (where I used to live), yet the zip code was correct, so our "wonderful" postal service forwarded the license upgrade to my PObox, yet they gave me a California call....
Moving to a vanity call that indicated Hawaii was a no-brainer for me, and I'd be willing to pay 20 bucks a year to keep it, so the increase in costs still make sense to me.... I know I may get a lot of flak from some people because of this, but it's all what it's worth in my mind.... It is a hobby, and thing that are outside "standard assignment" can be expected to cost a bit more. In my mind, it would certainly be worth less than 2 bucks a month to have a call that makes sense to me in place of one that is from an area where I no longer live.

Thanks

Source record: 14187

Odd... For some reason, this amplifier is available in kit form only, and only to Hams outside of the US of A..... They are located in Surfside Beach, South Carolina... Perhaps the Amplifier Kit does not meet FCC regulations (works for 11/10 Meters without Ham License verification)

I don't have personally verified information on this amplifer, and was interested in it before I found it couldn't be purchased from the manufacturer of the kit in the US..

If anyone else has better information on this amp, I would be interested, as I could use a low priced solid state amp if it doesn't pollute the bands I work. (primarily 80, 40 and 20 meters)

Thanks

I can't offer much help, but I would think that you ought to try this with a dummy load instead of the antenna; Dummy load hooked directly to the radio.

If nothing else, it would tell you whether you have a DC voltage/grounding problem, or an RF problem.

Here's what I think is happening.

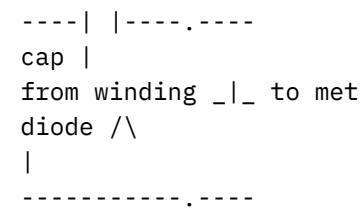
On 40 meters, the path from the tuner back along the outside of the coax to the rig is about as attractive to RF as the dynaplate, so a good fraction of the RF current being fed to the antenna goes that way. On 20 meters, the dynaplate is relatively more attractive due to a combination of the dynaplate impedance, antenna input impedance, and coax length, so more goes to the dynaplate and less along the coax.

The RF current goes along the outside of the feedline to the rig, over the outside of the rig, and into your inverter via the power leads. There are a couple of ways you can reduce the problem:

1. Put one or more good current baluns (common mode chokes) in the coax feedline. If you just put one in, I'd put it at the rig, to force the current there to be minimal.
2. Put a common mode choke in the power cable to the rig. Because the wires are pretty large, it's probably not practical to wrap multiple turns around a single ferrite core. So get some large clamp-on cores you can clamp over both conductors at the same time. It's likely to take a dozen or so, or more depending on the type of ferrite. I recommend type 43, or 70-series if you can find it in clamp-on cores.
3. Apply the same kind of choke to the inverter power leads from the battery.

What you're doing here is to create a high impedance to common mode current along the path from the tuner to the inverter.

If you'd like a quantitative measure of how bad a problem you've got and how effective any solution is (or if this is really the problem), get a clamp-on ferrite core you can clamp over the coax line or the power leads to the rig. Wind about 10 turns to make a transformer secondary winding -- the primary will be the wire passing through the clamped core. Connect the winding through a series capacitor of around 0.001 to 0.01 uF to a shunt diode (any small signal type will do), and then to a voltmeter:



Sorry, I'm not very good with ASCII art. . .

Clamp this onto the coax or over both power leads. The meter reading
will be approximately proportional to the amount of RF current. The
object is to minimize it.

Could be any of the three paths, or more than one at once... conducted
vs. radiated is an interesting question, but perhaps a bit academic.
All of your equipment is going to be in the near field of the
antenna/ground system, I think, and so you're going to be ending up
with RF pretty much everywhere.

If I had to guess, I'd guess that your inverter may have some sort of
half-bridge / push-pull switching circuitry. The RF getting into the
system is switching both sides of the push-pull drive into conduction
at the same time (a few volts of RF on the gates of the FETs could do
it) and shorting the supply through the FETs.

The fact that the RF was able to blow the FETs with the inverter
switched off suggests to me that it may be a fairly direct, local
pickup of RF onto the gates which did the damage. With the inverter
switched off, its controller wouldn't have been driving the FET(s) at
all.

As to how to prevent it from happening again... my guess is that your
best bet is going to be to add heavy-duty RF filtering to both the DC
inputs, and the AC load, and make the invert case as RF-tight as
possible.

I'm not sure whether it'd be possible to add snubbers, ferrites, etc.
on the FET gate leads themselves to keep the RF from triggering
them... the inverter design may require driving the FETs quite fast to
achieve proper control of the voltage. Figuring this out would
require a schematic and some study of the design.

It might be worth sniffing around inside the inverter with a grid dip
meter, with the power completely disconnected and everything
unplugged. You might get lucky and find a portion of the circuitry

that's actually resonant at around the frequency at which you're
having trouble. If so, spoiling the Q of this resonance might reduce
or eliminate the problem.

That does seem to be the case. As I understand it, it is not
currently legal to manufacture or sell an external power amplifier (or
sell one as a kit) which can operate between 24 and 35 MHz. Such amps
cannot be certificated, under current FCC rules, and external power
amps are the only sort of amateur-radio gear which does require
certification. I don't believe that ham-license verification comes
into it at all, in this particular portion of the rules - commercial
amps simply can't be manufactured, or kitted, or sold in new condition
to anyone, if they can amplify between 24 and 35 MHz.

The FCC has proposed (on their own initiative) that this restriction
be dropped. It was never popular with hams and manufacturers, for
obvious reasons, and it doesn't seem to have been effective at keeping
CB "linear" amps from being churned out and sold in quantity... the
original goal of the rule.

3719. New Program. L-match Networks.

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-14 09:10:26 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <ddn1q1lcv1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 14192

Occasionally it may be useful to deduce the value of the terminating impedance of an L-match network when only the values of the coil (uH) and capacitor (pF) and the frequency are known.

Program L_NETWK does exactly that.

The terminating impedance is often the input impedance of the transmission line leading to an antenna when an impedance measuring device is not available. Whereas it is possible to estimate the values of the coil and capacitor settings from a visual examination. The L and C components having been set by using the SWR meter or TLI.

The program also assists with assessing the range of terminating impedances which can be accomodated by a given L-tuner. Without such assistance a considerable strain is placed on an ordinary person's imagination.

Download in a few seconds program L_NETWK from the website below and run immediately. No unzipping inconvenience.

Since my boat, like many is made of fiberglass, obtaining a
ground/counterpoise is a tad tricky. Steel boats don't have a problem
but glass boats do.

So what is commonly done is a dynaplate is added to the boat. It's
basically a highly conductive copper plate that is through bolted to the
hull and is in contact with the sea water under the boat. There's a stud
on the dynaplate to which you attach a copper foil coming from the tuner
ground stud.

2. Put a common mode choke in the power cable to the rig.

Because the wires are pretty large, it's probably not

practical to wrap multiple turns around a single ferrite

core. So get some large clamp-on cores you can clamp over

both conductors at the same time. It's likely to take a

dozen or so, or more depending on the type of ferrite.

I recommend type 43, or 70-series if you can find it in clamp-on cores.

3. Apply the same kind of choke to the inverter power leads from the
battery.

A source of supply of 'big'! toroids for this kind of
suppression is the deflection coil toroid from old
TV sets. Some of them are enormous! And cheap. (read - free)

I use them round the shack liberally. There is enough
ferrite in there to equal 10 small toroids. (by weight)

Cheers.

License verification is not part of the FCC rules. However most
manufacturers of amps will supply instructions on how to modify them for
12/10 meter operation upon proof of license.

Yup. It's legal for a licensed amateur to perform such a modification
(no more than one amp per year or one per model per year, I can't
remember which), and it's also legal for an amateur to sell an amp
once modified to another amateur for amateur use.

License verification isn't required by the FCC, but I imagine it's a
good way for a manufacturer to show a good-faith defense against
charges that they're selling amps intended to be modified for CB use,
and for amateurs to make sure that they're selling used amps in a
legal way.

The wording is no more than one unit of one model. Interesting that
you can build one from scratch, or modify a commercially built amp,
but you cannot build one from a kit capable of operation below 144

But you can build a kit and modify that. I used to use a Heath SB1000
amp. I enabled 10m from the start - just did not install the wire that
prevented it from working. That's about as simple as a mod can get and
still not cause a problem with the FCC about not readily modifiable to
operate on 27MHz.

==========
Thank you for the above info. Now understanding the situation better , it would perhaps be beneficial to have a 'tunable counterpoise' between the transceiver ground connection and the dynaplate.
It is in fact an adjustable series tuned circuit comprising a air-spaced capacitor and a roller coaster or switch-tapped type of variable inductor which is tuned for minimum impedance with the aid of an integral RF current meter (as described by Roy ,W7EL) Tuning is done for each band by maximising the current in the counterpoise at low power.
For the latter it is best to use a sensitive microamp meter ,its sensitivity adjustable with a potmeter
Such a tunable counterpoise can also be used very well in a high rise apartment where there is no good RF earth .
The end of the counterpoise is then not connected ,but since the RF voltage can be considerable ,the free end should be well insulated.
Such a device can be home brewed ,but a version with a switch allowing for several inductor taps is (or at least was) available from MFJ it's their model MFJ-931 ; Artificial RF Ground.
It was (in the early 1990s ?) described in QST , by Doug DeMaw , W1FB (sadly now SK)

I have home brewed the above type of artificial ground made with a roller coaster inductor.
For the HF bands the inductor is to be adjustable between approx 0.9 to 43 microHenry ,with the variable capacitor being 200 -250 pF max.

My National NC-54, i think, had the same design feature! :-)

Sensitivity on 10 meters was, well different. I could hear W1VUO and W1GID with excellent Q5 copy. I could never hear who they were working!

I figured out that it must be my receiver. After all, W1GID lived 200 yards North and W1VOU lived 1/2 mile west. Never heard anything else on 10 meters until I bought a REAL radio, HQ-140X.

BTW, in Boy Scouts I did build a Regenerative for 6 meters. It earned a Worked All TV sets award :-) Channel 2 is/was a major supplier in the Boston TV market.

I'm not sure about that John. 97.315 is pretty specific about kits.
97.315 (b) says that any amplifier kit has to be Certified by the FCC.
I would think the chances of getting the FCC to certify a kit of parts
capable of building a 10-meter amplifier would be slim to less than
zero.

Heath doesn't make kits anymore, and these rules were written after
Heath went out of the ham radio business. What you stated was true
many years ago. The only way to satisfy the requirements now is to
modify a factory built, certified amplifier, or build one on your own
from scratch without using a kit (unless of course you can find a

certified kit. Good luck on that.)

And of course you can always buy one from another amateur that is already modified or buy one purchased new prior to April 28, 1978. My comments above were related to buying something new.

Dick

I would check a couple of things. First of all, I would check the LO injection to the display unit.......next, I would check for a bad ground connection, corrosion, etc. This could cause this type of problem.
Hey, thanks for the TR-751.......it is a nice unit.

Pete

Let's face it, Morse had an important need at one time in the history of radio. As a result, many amateur spent countless hours perfecting this craft. I'm glad they did.

However, technology has advanced (thank God) to a point where Morse is all but obsolete. My hope is that when the FCC removes the Morse requirement, more amateurs will spend that time improving their technical abilities.

The nice thing about amateur radio is that it flexible and offers many (very necessary) opportunities to its ranks.
I believe the Morse requirement just distracts people from other more exciting (and more necessary) aspect of the hobby.

Waters And Stanton

I purchased a scanner radio from this company and have had nothing but
trouble with them since.
I first ordered a Icom R5 for £89.00p (used) I paid for this using my
wife's debit card, it arrived on 3/8/05. I sent it back to them on the
4/8/05, they recieved it on the 5/8/05.
I requested the debit card be refunded with the £89.00p. I was assured
via email from a "Nigel McAlpine" that, and I quote .....
----- Original Message -----
From: "Nigel McAlpine" <mcalpinen@wsplc.com>

> Web: www.wsplc.com
> E-mail: nigel.mcalpine@wsplc.com <mailto:nigel.mcalpine@wsplc.com>

I telephoned them on the Monday only to be told that the money was
debited to my wifes card on the 3/8/05 ??????
I don't know how they managed this as I did not send the radio back
untill the 4/8/05.
I was also charged for "next day delivery" it did not arrive, I phoned
them and it had not even left the store, (another rip off) and lies.
Now it is the 16/8/05 and still the £89.00p has NOT been debited to my
wife's debit card.
I emailed them today, but they do not have the decency to reply.
I shall give it till Wednesday and if I do not hear from them or have
not received the £89.00p I shall pass the matter over to the Trading
Standards Department.

I shall keep you posted about this rip-off company.

Never read so much rubbish. I have done business with Waters & Stanton numerous times with no trouble, and so have thousands of others. If *YOU* bought something and changed your mind then that's your problem. They don't offer a try before you buy service like catalogue shops.
Please don't keep us posted, no one is interested. If you had a case you wouldn't be shouting about it here. I think you have probably been told exactly what the returns policy is and have been unable to bully them into doing things *your* way. I hope they sue you.
Waters & Stanton is a perfectly reputable company, which is why they are well known. Moaning old people tend to be forgotten about, so give it a rest.
Please also check your newsreader settings as you have posted to a lot of groups, so I have replied to the ones you used. You will now be placed in the killfile where you belong.

Was the claim that it was "debited on 3/8/05" a misunderstanding - that would appear to be the day they would have debited your card for the sale, not credit for the refund. There may just be a misunderstanding so maybe check again that the boss knows there should be a *refund*, rather than just the original debit.

Good luck.

Ken

Suit yourself pal, just telling people that they are in no hurry to refund
your money, by the way, the returns policy is 7 days no quibble, although I
expect you know about that if you have been dealing with them for years, eh

I wonder if this guy "ade" works for W/S :-))
I tried them once, they were not much help.
If they owe you money, give the trading standards a call
ghr

I see you deleted the most important part, that is, the confirmation email from them stating that the money WAS being refunded.
I am not bullying them at all, I returned the scanner under the 7 day returns policy because it was "deaf" end of story. I now await my very long overdue refund, what's your problem.

I'd be checking with the bank as well. Unless they are different beasts in UK, they have been known to have sticky fingers and not pass on money as quickly as one would otherwise hope.

Hi Ken, yes, done that. they state that no transaction for a refund has been
recieved by the bank.
Ah well, we shall give it a few more days.
It's ridiculous though as it takes them all this time, and yet about 3
months ago I had cause to return a faulty item to Maplins, they had no more
in stock, offered me a refund and it was back in my bank in under 48 hours,
so far it has taken W/S 13 days, and still nothing :-((
cheers

Lesson learned here....

ALWAYS use a regular CREDIT CARD for these transactions. Period.

Had you done that, either the refund process would have been easier, or, you could have directed your spam to the credit card company in the form of a dispute, instead of whining about it here.

Using copies of your e-mails from W & S, you would have had a SOLID credit dispute and the CC company would have to credit the amount and investigate the matter thoroughly on your behalf.

I assume the Fair Credit laws are similar in the UK to what we have here in the US.

Dan

[Snipped complaint and personal email]

Well, I have to speak as I find ..and in my recent dealings with W&S, they
have been excellent.

I purchased a used Yaesu VR500 from them after spending about 90 minutes
trying various other scanners, together with a micro mag mount and a gainer
rubber duck.

After a couple of days at home, it became apparent that I required some
additional functionality that was offered by one of the other models I
tried, together with another antenna, larger than the micro mag mount.

I returned the scanner, micro mag mount and gainer rubber duck and
exchanged the lot for a new Uniden Bearcat UBC3300XLT, together with desk
top dipole.

I got a full refund on everything I bought, without quibble against the
subsequent purchases.

The staff were helpful and courteous at all times...and I left the store
thinking "That's what I call service"!!

I would definitely recommend them to anyone and would not hesitate to use
them again!!

Next time - why not use the telephone - despite our advancing
technologies and the growth of internet purchasing, gripes, complaints
and problems are often better dealt with by actually SPEAKING with someone.

WR.

Read the Distance Selling Regulations which cover transactions of this type.
They offer protection for purchasers including the facility to return goods
after they have been received.

After 'experiences' with the competition, I have always used Waters and Stanton and have spent a lot of money with them over the years without a single problem. I have always found them to be polite, friendly and helpful.

Considering the high number of transactions that your bank, credit card company and W&S make each week, its inevitable that one or two of those transactions are going to go wrong now and again...its just one of those things.

However, your attitude is going to make a big difference in resolving the situation. Having a x-posting temper tantrum on usenet isn't the best way to deal with the situation and it isn't going to stop me buying stuff from W&S.

Have a little patience, discuss the problem with your bank and W&S in a polite and non-accusing manner, and I'm sure that before long you'll be happy to demonstrate your personal integrity by x-posting once again to tell us that W&S wasn't to blame after all.

I think you must be a company stooge, or arse licker, I have dealt with the company three times, once they got my order correct, the other two times were a disaster, a 33% success rate and you call that good ! wrong items arrived LATE, and refunds took an age to return to my account. I buy direct from the states now, far cheaper even with postage, and plenty of change over compared to the rip off Britain emporiums.

Use the telephone!!!!
I have phoned them EVERY DAY, sometimes twice a day, since they received
the radio back, and still I am getting no-where.

I have had numerous radios, scanners over the years and normally test them
on the Bristol Airport ATIS, all my previous scanners etc could receive this
on the supplied stock antenna, then on the base antenna, all the scanners
would obviously show a greater signal reading. This R5 could not pick it up
at all. and only just about pick it up on the base antenna (no, the att was
not on) I compared it straight away with my VR-500 on the same antenna, and
the vr500 showed full signal.

I can understand all the people who have had good dealings with W/S who have posted in in their defence, but if you had spent the past ten days being told one thing, and then another, promised this and promised that, spent ages on the phone day after day and still not getting anywhere, maybe you would think differently. I have dealt wth other companies obviously, (some good, some not so good) but have never had reason to actually post on the groups about it, the matter was always satisfactorily solved with a day or so. But these are beyond a joke, it is like banging your head against a brick wall.
It is a pity I live over 130 miles from the store, otherwise I would of been in and got it sorted by now.
I tell you though. I definately WOULD NOT recommend this company to anyone.
You are entitled to your opinions, then please allow me to be entitled to mine. If by my posting I have caused just one single customer to go elsewhere, and not have to go through what I have, then my posting has been worth it

This is for "ade" who states I am not entitled to any refund.....
Here is a copy from their website regarding the distance selling returns
policy.
quote.....
OTHER RETURNS - NO QUIBBLE & NO FUSS RETURNS POLICY

If you purchase products by mail order, you have the right to cancel the transaction for any reason and return the products within 7 days after delivery for a full refund (but not the original carriage charge). Products must be returned in as new condition together with all accessories, instructions and original manufacturers packaging. Failure to do so may incur a charge for replacing the missing or damaged items. In order to avoid administration delays, we urge you to first telephone us for a Returns Note number which should be clearly written on the outside of the parcel. We can arrange collection if required, but you will be charged for the carriage costs incurred by us.

end quote.....

The radio was returned by post in less than 2 hours of my receiving it.

No way is W+S a rip-off company. I have used them many times, ordering stuff over the Internet, and they are always very reliable and very efficient.

I'd use them again and again.

Simes

Most libraries carry at least one copy of the ARRL Handbook, or at least
that's been my experience. It may not be the most current, but it's
within the past few years. In Orange County, Calif. they usually buy
one per year per branch, with the most current one in the reference
section and the older ones available for check-out.

[This followup was posted to rec.radio.amateur.equipment and a copy was sent to the cited author.]

Sounds like you've already picked up some good advice. If you want some good software to go with the Now You're Talking book, you might visit the W5YI website at http://www.w5yi.org/catalog.php?sort=18 and check out the packages they have. They're basic programs that drill you on the questions that will be on the test, so you can get yourself proficient before going in for the exam. I used their older DOS-based stuff for my tests some time back, worked very well.

I believe it also includes Morse training and practice software, which will be helpful if you want to go for your HF privileges (at present, the FCC still requires a demonstration of Morse proficiency before you can gain access to the HF bands). In training for my Morse exam I found that the tapes are only good up to a point, after which I found myself memorizing the tapes, so they weren't much good after that. Computer-generated Morse practice can keep the material fresh so you're never copying the same stuff over and over again, as you would with tapes.

On the matter of clubs, I've had mixed experience with various clubs when I was first getting started. One that I visited was pretty clique-ish, so much so that the only person that took any time to chat with me was the guest speaker! I've been good friends with the guest speaker ever since, but I've never darkened the door of that club since. I found that this was the exception rather than the rule -- nearly all the other clubs I've visited since then have been more than welcoming to all new visitors, so if you don't find a good club the first time out, shop around. The ARRL web site at www.arrl.org lists many different ARRL-affiliated clubs, so you should be able to find a lot of potential groups in your area.

You'll also find that your computer skills will dovetail nicely with the newer modes that are available for your use on the ham bands. Packet (especially APRS these days) and PSK31 are good examples. There are also video modes -- slow-scan TV (SSTV) and amateur television (ATV) -- that you could experiment with if you're interested.

Welcome aboard!

I was merely pointing out that I discovered the radio was faulty immediately upon receipt, I sent it back straight away by next day before noon delivery. My point is that they are adamant that they paid a refund back to my debit card on the 3/8/05. this is very strange as I did not receive the radio until the 4/8/05. and to this day, 17-August-2005, no refund as yet.

I have a 115AH deep-cycle battery that I bought as a stand-by battery for my amateur radio station. It has been in a "battery box" on trickle-charge (using a charger with a "deep-cycle" setting) for most of the time since I bought it over a year ago, and it has been called on to supply power only a few times.

Recently I noticed that the "fully charged" LED on the charger was not on and started investigating further.

Having not encountered any batteries in the last few decades that have not been sealed and "maintenance free," I was surprised to find tiny print about checking the electrolyte level every 30 days -- but even then it took me a few minutes to figure out how to get access to the cells to check this.

Anyway, when I removed the cunningly disguised covers, I found that the cells looked totally dry, and each took close to a pint of distilled water to bring the electrolyte level above the plates.

The battery has now been on charge for about 20 hours at the charger's 12A setting, but most of the time the ammeter on the charger has shown only about 5A. The cells are all still gassing.

Is this battery likely to come back to life again, or is it toast? Any remedial actions to take?

Perce
(This is my usenet alias. I *am* an FCC-licensed "ham," but my real name and callsign have no relevance to this question.)

3792. Drake L-4B male VOX plug

I have brought my L-4B linear out of storage, but I have lost the two prong male VOX plug. Does anyone know where one might be located and what type plug it is? I had assumed it was a 2-prong Jones plug with flat blades, but the holes look circular in nature. Could someone give me some guidance on the name and type of plug and where one might be purchased?

I think that connector is going to be hard to find.

Since all you really need is a single conductor jack (one side of the
VOX jack is grounded) why not just change the connector out for a phone
jack or something more common?

Found this while Googling....it may help you make a decision about what to do.

http://www.mail-archive.com/drakelist@www.zerobeat.net/msg02064.html

Those two pin connectors are one of the most "unobtainium" items in the 4 Line. Even Drake gave up on them, and offered a small metal plate with an RCA phono jack on it and two holes that matched the mounting screws for the two pin connector. The pins are spaced 0.350" c-c.

If I didn't have one, I'd seriously consider doing the modification with an RCA Phono jack like Drake did. And I'm one of the worst when it comes to preaching the "keep it original" mantra...

Once in a great while one of the two pin connectors will show up on E* for an exorbitant price. The last one I saw a few years ago went for over $20...

The pins are 0.093" in diameter. Some have made a connector from #11 solid copper wire. Various schemes have been tried with plastic and/or epoxy to build up a connector body around the two pieces of wire. #11 wire is 0.0907", and tinning it with solder should make it just about right. I would tin it to ward off corrosion. Unfortunately, #11 is NOT a common size (to say the least!). #10 is 0.1019", which is a little large, and is probably what the "plug builders" used. I don't know if that is large enough to damage the female connector or not. The pins are spaced 0.350" c-c. A better choice might be some 3/32" dia (0.0937) brass tubing from the hobby shop. It would give a more reliable electrical connection to the wire. Think that's what I'd do.

More from the thread:

What I did....Break out 4 pins from an old octal (8 pin) tube
base...Easy with a pair of pliers...Solder them on to a piece of lamp
cord...Most newer lamp cord is polarized if you look closely, this is
handy 'cause you'll need to respect gnd....The pins fit perfectly and
"snug" in the connector holes...Push it in right up to the
insulation...I've been using this set-up for years

I appreciate your comment and advice. My L-4B is in near mint condition, and I am leery about making mods to the amplifier, although I have updated the series HV electrolytics and diodes in the power supply. My current thinking is to jury-rig a connector by using tinned #10 copper wire!

My sense is that the battery's capacity will be severely impaired. You may have the voltage, but the ampere hours won't be the same. A pint per cell ... the poor thing was dry!

Trickle Chargers do just that ... constant low rate. But doing that to a fully charged battery warms the cells and evaporates electrolyte. Monthly service is probably about right.

A better solution is a battery 'tender' or 'maintainer' that totally cuts off the charge current based on battery voltage. Kits for these are advertised in QST.

3802. Radio Shack 10 Meter rigs, HTX-10 vs. HTX-100

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-16 17:00:30 UTC
From: WØCBF <w0cbf@yahoo.com>
Message-ID: <1124211630.517632.128730@o13g2000cwo.googlegroups.com>
Source record: 14075

I have been thinking of installing a 10 meter rig in the truck. I had, several years ago, an HTX-10 and it worked fine when the band was open.

My question would be if I want to operate 10 meter SSB (only) and not FM is the HTX-10 superior to the older HTX-100???

The prices on eBay are reasonable for both units but the HTX-100 is cheaper.

Thanks for your help

Well, either you or I are misreading the auction status. I think there
were 3 items available and only two buyers.

It sounds to me that it is likely to survive, but I hope you
are not over charging?! I assume you are also monitoring the voltage? To
be sure how it turns out, you really ought to get a guage to measure the
specific gravity of the electrolyte in each cell and check. Should be
available cheap at auto supply stores.

Yes, you are correct! I did read it incorrectly, two purchasers each wanted 1 item, and so I am hoping my e-mail to the seller will get results. In the meantime I have tried a piece of 3/32" brass rod and it fits perfectly. What I should do is buy some epoxy and improvise a plug body, but the temptation is to just solder a piece of shielded cable to two short pieces of rod and plug them in. No harm is done if they are plugged in incorrectly, the amplifier will just run all the time, and I think that would be noticed immediately.

Sounds like you've got it under control, John.

Good luck - just out of curiousity and completeness, please post back and let us know whether the eBay'er is able to provide you with the conversion kit. In the meantime your homebrew plug should work just fine.

>Didn't the builder of these kits get cited by FCC a couple of years ago for
>selling them?

I don't know the details, but that certainly seems to be implied by
what he writes on his website when he explains why his products are
only available for sale to non-US amateurs.

He complains that only one company (Communications Concepts) can get
authorization from the FCC to sell certificated amplifier kits. In
looking through the Communications Concepts web site, though, I don't
see any _complete_ amplifier kits at all, nor do I see any discussion
of certification status.

C.C. sells PC boards, and selected sets of components which can be
used to construct some of the Motorola reference-design amplifiers,
but they state quite clearly that they do not provide manuals,
heatsinks, chassis, connectors, etc. needed to complete the amplifier.

Since you cannot construct a working amplifier solely from what
Communications Concepts is willing to sell you, the result isn't
something which would require certification. An amateur could
construct one amp per year using their components (plus others that
s/he acquires elsewhere) without having to have the resulting
amplifier certificated.

I suspect that this is the difference. Communications Concepts is a
component supplier (and components by themselves do not require
certification), while the kit builder in question is providing
completely kitted amplifiers (which do require certification). That's
probably enough to make the difference between all-is-OK, and an
enforcement action.

The kits *could* have been designed in a way which would allow them to
be certificated - they'd just have to have a difficult-to-defeat
rolloff of the upper HF frequencies - but the designer didn't do this,
and for this reason they don't meet the current rules for certification.

This issue seems likely to become moot within a few months, as the FCC
is proposing to drop the restriction on construction and sale of amps
capable of operating in the upper HF band.

The battery may be recoverable, but I suspect it's going to take some
effort, and it may well have passed the point of no return.

The fact that the cells are drawing low current, but are
electrolyzing, suggests to me that you've got a combination of a high
charge voltage (above 14.4) and some pretty badly sulphated plates.
The bottom parts of the plates (where there was still some
electrolyte) may be OK, while the upper portions may be sulphated
and/or the separators may be clogged with solids.

First thing I'd do, is just give it some time on the current setting,
checking the electrolyte level periodically and refilling as
necessary. Given some time, the relatively high voltage may clear out
some of the sulphation and residue.

If not, then it might be worth trying to recondition the battery.
There are electrical desulphators available, which hit the battery
with a high-voltage high-frequency pulse in order to break up and

redissolve the sulphate crystals - some people say these work very
well, others are less impressed. I've also seen chemical desulphation
suggested, via the addition of some sort of chelation chemical (I
think EDTA is used but don't trust that possibility without
confirming it!).

If some of the plate material has disintegrated and fallen to the
bottom of the cell, then the battery is probably a goner. The residue
can end up shorting the cell.

You are probably correct in suggesting a hydrometer. But I should have
mentioned that the "fully charged" LED has not yet illuminated again;
I'm assuming that that is supposed to indicate that the appropriate
voltage has been reached. With the charger disconnected, I read 13.4V --
still a little low, I think.

Also, although I mentioned that the battery had been on "trickle charge"
for all that time, I was in fact using the specific "Automatic -- Deep
Cycle" setting of the charger, which I "assumed" (there's that word
again) was "supposed to" (and that phrase again) prevent overcharging.

Hi!

Just got an Yaesu FL-7000, and found out that the SWR meter is behaving in a strange way. The antenna tuner also seems to have some troubles to tune to an optimum SWR, espcially below 20 metres.

I did like shown in the manual page 13 (added 3 * 50 Ohms dommyload in parallel and TX freq = 14 MHz), and found out that the SWR meter is only showing around 1:3 when the TX power is about 100W. Increasing the power to 200W makes the SWR meter go to max, and decreasing to 50W it shows about half of what it did at 100W.

I have an external SWR meter attached, and it says 1:3 all the time :-)

I also discovered that the SWR indication is frequency depended. On 80 metres it's impossible to make it show more than about 1:1,5 with 200W TX power.

I did some measurements on the FWD and REF points, and the difference between them seems to be okay, and my conslusion is that the SWR bridge is okay. Just to make sure i measures the diodes, and they seems to be intact.

Studying the schematic tells me that the transistor Q05, and the op-amp Q01 is involved in calculating the SWR, but I have no service manual to tell me about values that can be measures, and used to identify the problem.

Anybody with similar expirence, or just good advices?

Best 73 de OZ1BV, Brian

Perce

Living on a boat, I deal with deep cycle batteries continually.

EVERYTHING ABOARD runs off of my batteries and I take good care of them since I hate cold beer. (yes 12vdc refrigeration)

The uncovered plates will have begun to oxidize as soon as exposed to air. The liklihood of being able to recover from that depends on how long they were uncovered. By the way, a "fully charged" 12vdc battery, when not connected to any load at all, and not charging, will read 12.6 volts. So reading higher as you stated is a positive indicator.

When batteries are charged they are (or should be) put through three stages of charge:

Bulk charge - where the battery accepts about 80~90% of it's capacity to charge. A lot of current can be put into the batteries through this charge. When bulk charging I see 50 amps or more.

Absorbtion charge - topping up the battery until the voltage reaches around 14.1 volts. The amount of current put into the batteries tapers off during this charge as the voltage increases.

Float charge - once FULL absorbtion voltage (14.1) is reached, the charger should drop the voltage back to around 13.25 or there abouts, and current is minimal (a couple of amps tops). That's the charge the keeps the battery topped up.

The LED on the charger may be nothing more than a volt meter reading. There is no way to know what your charger is doing without the specs. Most lower cost chargers don't really do much but shut off at a pre-set voltage. Perhaps the LED indicates that the charger is off, and you can measure with a volt meter to see what point the charger shuts off and deteremine how it handles charging. Refer to the voltages above to see when it shuts off and that will give you a rough idea of what the charger does.

As for your battery and it's possible damage:

There are a few things that you can do. First, as already suggested, top up all cells and watch them as you charge the battery. If one cell tends to loose electrolyte much more quickly than the others, the cell is bad and the battery is toast. In simple terms (it's a bit more complicated than this) a cell that is bad will be shorted, and the short causes it to get hot, and that boils off the electrolyte. Similary, if one cell

seems quite hot compared to others, the battery is toast.

Pick up a hydrometer and check all cells with it after charging and letting it rest with no load for 15 minutes. Any LARGE differences after charging indicate that the battery is toast. If a cell reads partially charged and all others read charged, the cell is in trouble.

If charging for a period of time (overnight) doesn't bring the battery up to an even charge on all cells (as measured with the hydrometer) after 15 minutes no charge, no load, then there is one last ditch effort you can take.

You can equalize the battery. Basically the battery is significantly overcharged in an effort to redistribute the electrolyte and force the sulphur on the plates (called sulfation) back into the electrolyte.

Typically, the voltage applied is about 16vdc, and the equalize is done over about 8 hours. The battery will bubble like mad so remove the caps to allow it to vent. It will give off explosive hydrogen gas, so no open flames...take all precautions to prevent explosion. And it will loose electrolyte so you'll need to top it up during the process. Since it is a high voltage charge, turn off or disconnect all loads. In my case I turn off all breakers, fridge, stereo, instruments, Han radio, everything that is powered is disconnected to prevent damage.

If after a full equalize the battery cells differ substantially when measured with a hydrometer, the battery is history.

I hope this helps.

3833. resonance: power supply vs. frying pan

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-17 17:57:06 UTC

My ham radio 110->13.8 V power supply interacts with my electric frying pan. No matter how far away in the house I plug them in, there is a harmonic that causes the power supply to make a loud hum.

I must choose between rag chewing and food chewing. Help. What gizmo can I purchase to filter out the resonance between them? Actually, it only happens when the pan is switched to "low", not on "high".

What these symptoms suggest to me is that the "low" setting of the pan is probably switching in either a half-wave rectifier diode, or some sort of triac-based switcher... the former seems more likely. This would cause the pan's load on the powerline mains to be very asymmetrical... it'd draw full current during one phase of the cycle and none during the opposite phase. This will have the effect of causing the mains voltage at all of the other outlets on the circuit to have a significant DC offset voltage. This will induce a current into the primary winding of other transformers, possibly saturating the core (a bigger problem with toroid transformers than with EI-core, I believe). The symptoms are usually buzzing and humming, and sometimes excessive heating in the windings and cores of affected transformers.

Triac-based switchers, such as are found in many cheap light dimmers, tend to cause a slightly different set of problems. They don't generate a DC offset, but they do generate a lot of odd-order harmonics. They can cause transformer buzzing and the "singing" of light bulb filaments.

There are a number of possible solutions, none of which are terribly wonderful:

- Replace the electric fry-pan with a different model that doesn't cause the problem. For example, a model which has multiple heating elements, and switches them into different combinations of series and parallel and disconnected states, can provide multiple power levels without having to use a rectifier or triac - it'll always present a well-behaved resistive load to the mains and won't cause the problem.

- Put a high-amperage isolation transformer between the frypan and the mains. This will prevent the DC offset from travelling back onto the mains. The isolation transformer may hum or buzz when the pan is on its low-power setting, but the problem at your power supply should be greatly reduced or eliminated.

- Put the isolation transformer between your ham supply and the mains. The isolation transformer may be less prone to hum or buzz than the power supply's transformer.

- Try a ferroresonant constant-output-voltage transformer (Sola makes these). This will ensure that your power supply receives a fairly consistent AC waveform. [Unfortunately, these ferroresonant transformers are themselves somewhat problematic... they run hot, hum, and their output isn't a terribly good sinusoid even in the best of times.]

- Change to a different type of power supply. A ham-rated switching-type supply might be much less affected by this problem.

- Unplug your ham supply from the mains when the fry-pan is in use, and operate your station from a large battery during those times. Recharge the battery from the supply when the fry-pan is not in use.

- To mis-quote the old saying, "Be cooking with gas!"

> My question would be if I want to operate 10 meter SSB (only) and not
> FM is the HTX-10 superior to the older HTX-100???

Chuck-

I have both. The HTX-10 is newer. As I recall, the HTX-100 doesn't have
any memories, if you happen to have some pet frequencies.

One fault with the HTX-10, is that it doesn't retain its memories when
disconnected from power for very long. I modified mine to add a Lithium
battery plus isolation diode, so the memories don't evaporate.

The HTX-100 is a variation of the Uniden HR-series Ten Meter radios.

The HTX-10 is a variation of the Albrecht AE-485S. I found some
information at
http://www.albrecht-electronic.de/service/Amateurfunk/AE485S/.

I don't think anyone would be able to tell the difference between the two
radios on the air, other than the HTX-100 being calibrated off-frequency
by 100 Hz!

There are now some absolutely wonderful mobile rigs for around and under
$800 brand new. They can also be used for base rigs. Check out the Yaesu
857D and the Kenwood TS-480.

Jet-

I have an old Kenwood TS-690SAT which is the same as the TS-450SAT except it has Six Meters. One of either in good condition would make a nice rig. The only thing I don't like is that on FM, the optional tone encoder uses dip-switches to set frequency. Optional filters should still be available for narrow sideband and CW.

A slightly newer rig that I haven't used, is the TS-570. It is available in two versions, one with Six Meters. I think the TS-570S is the one with Six, but I'm not sure. I think it uses the same filters as the TS-450.

I now use the TS-480 mobile with the built-in antenna tuner. It is also available with twice the power but no tuner. Mine works OK, but it is a bit big for a mobile rig, and you have to purchase the "mobile shelf" separately if you don't want to remotely mount it. It might be a good rig for you if you can find one in your price range. It is one of the newer models and uses digital signal processing (DSP).

Personally, I'd look for a bargain on a new-old-stock TS-570 if I needed an inexpensive rig.

Hi, Welcome back!!
you can pick up and Icom IC-706. There are different versions of this
rig, the newer ones
do 2 meters and 440. It's a small radio but it is menu driven. This can
drive you nuts until your
use to it. Also, check out a Yaesu FT-847. This radio gives you the
most bang for your buck!
This is a HF, 6 meters, 2 meters and 440 radio. This is more of a
conventional radio.
I have seen these as little a $700 through $1100 dollars. Also, the 847
is a satellite radio, really hot receiver
on 2 and 440!.
Check out these links if you like..

>Is there an announced date when this restriction is to be lifted, or is it
>still just a proposal?

To the best of my knowledge it's still just a proposal.

This proposal was part of the FCC's "Notice of Proposed Rulemaking"
released on 15 April 2004. This was the same NPRM in which the FCC
proposed accepting the ARRL's request to "re-farm" the Novice/Tech Plus
CW sub-bands, reallocated these for phone operation, and proposed
accepting Kenwood's petition to allow auxiliary-station operation in
the 2-meter band (thus legalizing Sky Command).

The comment and reply-comment end dates were back in June of 2004.

I haven't heard anything recent about action on this. It would not
surprise me greatly if the FCC chose to do a single revision of the
rules, which would incorporate the changes in this NPRM and also
formalize the removal of the 5 WPM Morse Code requirement.

If that's how they decide to do it, then "sometime later this year" is
the best guess I can offer.

It works, but much depends on the condition of the battery.
According to the author, it eliminates the need for periodic
equalization, too. But it won't rescue batteries with
warped plates or shorted cells or those with too much of
the plate material gone, or polluted electrolyte.

Aside from attempting to rescue his battery, the OP has got
to fix or replace that charger, and adopt a maintenance
schedule that includes electrolyte level monitoring.

You didn't say how far away from the dynaplate the tuner was? I would
bet that you have a fairly long run with your ground lead to it as
seen in most boats where the antenna system has problems.
You need to have a very short distance between the tuner and the
ground plate, not more than a few feet. Lots of people install the
tuner close to the antenna and run a long ground lead. That is the
wrong way to go as it then allows the coax and power leads that go to
the tuner to become part of the antenna system as well as the radio
itself and its power leads, which you don't want.

Also if you operate in fresh water rather than salt water you may need
more surface area for a ground.

Sail boat or power boat?

Before you commit to that budget level be sure to look at some of the high end choices. I bought a Yaesu FT301D in 1978 and felt it was unbeatable for my purposes for over 20 years. I had some problem that I was looking for help with on the Internet and someone told me I owed it to myself to look at a modern rig. After I did my homework I settled on a TenTec Pegasus (no longer available). It was ideal for me. It takes up zero desk space because it uses a PC for all input/output. With the optional built in tuner and a multitude of filters, I find the operation everything I could wish for. The newer Tentecs seem to have the same features but also a front panel control. Early on I needed to call them (Tentec) and found them very accessible.

Considering that I paid about $800 for the Yaesu in 1978 (a new Ford Mustang was $4500 that year) I figure the $1200 or so that I put into this rig to be a great deal.

The other vendors have some really neat stuff as well. If I were still spending a lot of time on the road, I would want the Yaesu FT-857D mobile. 160 - 70cm in such a tiny package is mind boggling to me. You can buy it from http://www.universal-radio.com/catalog/hamhf/1857.html for $699 at this time.

Your satisfaction with any rig will be greatly influenced by the antenna you use. Back in the 70's Cushcraft had a reputation for being "cheap". I liked their products then and I like them now. I have an A3S beam with the 40m add on and seldom bother to extend the crank up (electric winch) above the 25 foot level. Being that low does have an adverse effect on the SWR but the automatic tuner does a good job of hiding that from me.

Things have never been better in the world of Amateur Radio!

Thanks for the great advice OM, but since I am now in my late 50's.. small does not seem to be that much of an option, the pc interface sounds interesting tho..
And yes a great sky hook can overcome some limits on the radio end, but with all the QRM I read about, it sounds like I will be looking for one with great filters and DSP capability,

Make sure you check out the Ten-Tec Orion. Perhaps a bit complex, but I was out of ham radio for 15 years and just got going again about one month ago. I took delivery of my Orion on last Friday, and so far it's working fine. I have it connected to a ground mounted Butternut HF6V.

I've had a 940SAT for 18 years - bought second hand from another ham -
and it hasn't given me any trouble ever! It has perhaps the best
receiver for it's time, and maybe still outdoes the new ones except it
doesn't have DSP. I love it. Go for it. Get one with the cw
filter(s). I have two inside and it's really narrow, if you want it to
be. Good luck.

Now that I know that this is not a "maintenance-free" battery, I'll get into the habit of checking the electrolyte level.

But are you saying that the "Automatic - Deep Cycle" setting on an "ordinary" battery charger (it's one I bought originally for the car batteries, but the "Deep Cycle" setting seemed like a bonus) is not a reliable way of keeping the batery in good shape?

I don't know what he's saying, but I'll say No, it isn't if it's a
run-of-the-mill cheapie.

Suggest you look at:

www.amplepower.com

and check out their primer. Some of this is self-serving but on
balance is good stuff.

It's quite possible that this charger is not well suited for long-term
float charging of a battery, "automatic" or not.

Many standard chargers are designed mostly for "refueling" a depleted
battery. They often use a two-step charging algorithm, to perform the
"bulk" charge (high initial current level which brings the battery up
to about 80% of full capacity), and then a "topping" charge (lower
terminal voltage, resulting in a lower current) to bring them the rest
of the way up to full capacity. The switchover between bulk and
topping charge happens automatically based on the battery's terminal
voltage and/or the current level... it's done at a point which trades
off the speed of recharge, and the possible loss of electrolyte.

The terminal voltage during bulk and topping charge can often exceed
14.5 volts, and might be over 15 volts depending on the charger design,
battery type, and temperature. It's high enough to result in some
loss of electrolyte, if the battery gasses rapidly enough that its
recombination catalyst can't turn the gasses back into water.

Many of these chargers do *not* incorporate circuitry which will
detect the "full charge" state, and switch over to a proper
float-charging regime. Proper floating voltage is a good deal lower
than recharging voltage, and depends on the temperature... I've seen
figures ranging from 14.1 volts (freezing) down to as low as 13.4
volts (40 degrees C). It also depends to some extent on the specific
battery type and chemistry.

A two-phase bulk/topping charger is likely to keep the voltage on the
battery rather too high for proper floating. Gassing and loss of
electrolyte can occur as a result.

For best charging performance, you really want to have a sophisticated
three-phase charger, with temperature compensation for all phases of
the charging cycle.

As an alternative (possibly cheaper), use your car-battery charger to
recharge the battery after use, and buy/build a well-regulated
low-current voltage supply to use as a float charger. If your battery

will be stored in a location which has a relatively constant
near-room temperature, you could build a simple LM317-based voltage
regulator, trim its output for 13.6 volts, and be pretty confident
that you could float your battery on this without risking excessive
outgassing.

Yeah! Me too.
A copy of an email to ARRL below: I hope it gets some consideration.
I been around long time but restarting myself I find it a pain to compare apples oranges and lemons.
This is going to be worse than buying a car with all the "options" and or built in functions.
Getting started must be a real intimidator for someone new to all of ham radio.
When I started years back I had no good input from anyone and was Pixed off for 2 years
because I found no DX,... No one bothered to let me know novice bands were deserts lol
New hams always ask what radio to buy because the mfgrs and adverts make it hard to see
what is needed and what comes with a radio. Wooo a new person probably doesn't know a
lot of DX folks use split freq's to work the "pile ups". I lucked out with my GTX 757 II and
got a nice rig I could drop in the car or work in the shack. I once worked Mongolia from the
shack in Indiana and Saudi Arabia from the Indiana parking lot at work in my car 10m,. I never
thought those few watts could compete with the KW's ... just a matter of timing and luck mostly.
73 Good luck K4TWO
I'll be following the suggestions toooo
Thanks ev1

I don't know where this "complaint, advice, recommendation" should be squirted at, but this seemed to be a starting place.
ALL the files and adverts I see in QST or on the web can drowned and overwhelm a new ham.
What is ALWAYS missing is "what this radio needs to work is.... AC line... DC power supply... Antenna match... Types of Antennas a user might connect.
Sheeez get some of the basics out to the "New Hams" they want to sell these things too.
Let them know about how much MORE it is going to cost than the listed price of the current unit under test.
How about a Key or Speaker or Mic, need a rotor?.... Come on lets get the newbies a chance to spend his few dollars with out getting
a box and then wish for Christmas to come so he/she can connect it up and really get on the air.

Go look at the advert's and "reviews" as though you were NEW to the hobby
and about to invest some hard earned money.
While most of the tech info can be impressive, it is fluff to a newbie.
Just tell me how it worked and what needed to make it usable.
How much were all those "options they said were available?" Money for what
filter? What warrantee??? It is the price of a car is it 5 years too?
Thanks.... Hope this message gets to where it will do some good.
Might even put some "shop and compare tables" out for them.
I been around a long time and was getting ready to upgrade from my GTX757II
to a "last good radio" for my retired years and wading through
all the poo has just about put me off buying another radio. I did apply
for a new 4 land call for retired call... I hope Vanity call. Can get a
little vain when that's all that is left. hihi
I just spent 2 days rebuilding the optical dial that froze up in my 757 so I
better move on before it gets arthritis again.

Hi John
Yes, I followed the instructions exactly, Anyway, pleased to say the refund has finally reached the bank account, although it took 15 days, it amazes me how these companies can take money from your account within seconds, yet take over a fortnight to return it. As I said before, Argos and Maplins can do a refund in under 48 hours. It's not just the refund that pi**ed me off, I was charged for "next day delivery" I work nights (7pm to 7am) and had to wait up for the postman, then when it never arrived and after a few more phone calls I discovered it hadn't even left the store. this meant I had to wait up again the next day.
I wouldn't deal with them again.
regards

Sounds like you got this problem nailed Gary.... I would suspect that
the RF Ground between the tuner and the radio is somewhere close to 1/4
Wave and is the Power wires to the inverter are also near 1/4 Wave for
the 40 Meter band, or maybe 1/8 Wave. A couple of good RF Type .1 uf
Caps across Inverter Power Leads, at both ends, should tame the problem,
after the RF Ground is shortened up to make it a good Low Impedance,
Wideband RF Ground.

We already have strong evidence that the charger you used
cooked the electrolyte. I made no reference to the "universe"
of ordinary chargers - I was thinking specifically of yours.
But you raise a good point, expanding the question - and others
have answered.

Whatever charger you use, you need to verify that it is
doing the job properly. Consider building an add-on
monitoring/control circuit. Perhaps a comparator with
a sonalert to notify you that something is wrong with
automatic charger shut-off when the voltage exceeds
some level. I built a comparator into an ordinary
10 amp charger to turn it on and off automatically.
A 339 works fine - 4 comparators in one chip, so you
can have a voltage too low output turn the thing on,
and a voltage too high turn it off. Still have two
comparators left over to use as you like. Add a couple
more 339 chips and you could add a 10 step led
voltage monitor, for example.

Did you get a full refund...including any postage charges??

If you did..you've had a result as the passage you quoted states

"If you purchase products by mail order, you have the right to cancel the transaction for any reason and return the products within 7 days after delivery for a full refund (but not the original carriage charge). "

I suppose it all depends on whether you returned it as faulty or under the no quibble guarantee

As Dave said, a battery. It will give you emergency power
for the rig during field day or an outage, too. You can
keep it charged by running it in parallel with the supply
when the rig is on and the frying pan isn't.

Well, we don't know how much the charger contributed to the problem,
because the electrolyte level wasn't checked for more than a year
because I hadn't realized that it's not a "maintenance-free" battery.

> Whatever charger you use, you need to verify that it is

While looking for a hydrometer today, I noticed "Vector" brand "smart"
chargers (10/6/2A and 6/4/2A) that claimed to have 3-stage charging
circuitry and to be suitable for car batteries, deep-cycle batteries,
and gel-cell batteries. Are these likely to be any good?

The battery was still warm, and each cell was still bubbling slightly
after the thing had been disconnected from the charger for about 3
hours. The SG of each cell was pretty much the same at approx. 1.1175,

and the voltage across the whole battery was 12.4. When I put it back on charge, the voltage rose to 13.3.

What do you think?

Perce

I think the battery is bad. I may be remembering wrong, but I seem to
recall that SG should be around 1.230 for lead acid cells, I think. Also,
nominal open circuit voltage on a freshly charged battery ought to be at
LEAST 12.8 volts.

I'm not in the L.A. area, but I can certainly program your radio
if you don't mind mailing it to the vicinity of Seattle.

Assuming there's nothing wrong with the radio, and that you're
doing a full 16 channels, I can do the programming and a bench test,
including any necessary alignment, for $30 plus shipping.

Please note that I would need your ham callsign (if doing amateur
frequencies) and/or your commercial callsign (if doing commercial
frequencies).

This link contains details:

http://www.bluefeathertech.com/rf.html

You need only drop me an E-mail if you want to set this up.

Thanks much.

It does make one wonder, if indeed individual IS an amateur, how he
could pass the exam, and not be able to program his radio?
Perhaps in the future the only way to keep out the riff-raff will be to
make the radios require at least a three digit IQ to work?

I see you are in the two digit catagory. The HT 1000 takes a special plug and computer software to program it. To buy this could cost more than most ham HTs. Not something most hams have in their shacks.

Bought a 147 with a similar problem. No mention was made by the seller that it was heat-related, just that it would blank out, and sometimes a tap (or a sharp rap) would fix it. Opened it up and re-seated all the boards and ribbon cables (as I recall, the display connects to the main board with a ribbon cable). It's been running 24/7 as my APRS rig for better than six months, and the display is still working fine.

In article <oZ6dneEleLlofZjeRVn-sg@comcast.com>, w2agn@pobox.com says...

<snippety>

> It does make one wonder, if indeed individual IS an amateur, how he
> could pass the exam, and not be able to program his radio?
> Perhaps in the future the only way to keep out the riff-raff will be to
> make the radios require at least a three digit IQ to work?

You misunderstand. The radio the original poster is referring to
is a Motorola HT1000, a discontinued commercial portable that is not
front-panel programmable in the least.

Programming the HT1K's requires a special cable, one that is
proprietary to Motorola, a Radio Interface Box or RIB, which shifts
levels between RS232 and TTL, and programming software (also proprietary
to Motorola).

Just getting the software is a challenge. It runs over $250, can
only program two families of Motorola portable (the HT1000 and Visar
series), and purchasing it requires the execution of a six-page written
licensing agreement that is downright Draconian in its terms.

The programming cables, assuming one buys both the HT1000 and
Visar cables (they're different) represent another $300 or so between
them.

Finally, once the radio is programmed, it needs to be bench-
checked against a service monitor (aka, an RF communications analyzer)
for on-frequency operation, modulation, spectral cleanliness of the
transmitter's output, TX power level, and receiver sensitivity. A good
service monitor can run (used) anywhere from $1,000 to $8,000+ (mine was
$2250, and I had to invest another $1600 into it for repair and
calibration).

These are serious $$. Investing in all that is impractical for
just a single radio owned by a single individual. It was, however,
eminently practical for me because a big part of my side business is the
conversion of commercial gear to amateur service. The right equipment
easily pays for itself over time.

I can't comment on the chargers you mentioned - I don't know
anything about them. But I wouldn't trust any charger until
I have verified that it 1) does charge the battery, and
2) does not overcharge the battery. And even that has the
possibility of error. A charger that works fine at 50 F ambient
may not work right at 80 F. So my testing, at 50 F, may
not reveal a flaw that occurs at 80 F. (Or vice versa.) The
terminal voltage - the voltage across the battery at which the
charge should terminate - varies with temperature.

Concerning your battery's SG: either your SG tester or the battery
is bad. The SG reading is too low. To verify, check the specs
on your battery with the manufacturer to see what they say the
SG should be. I believe the battery is bad, as there is
corroborating evidence from other facts besides the SG reading

Regarding my comment that there is strong evidence that your
charger is bad: the electrolyte level didn't go down due to
leakage. The alternative is that it went down due to evaporation,
which is a result of heat, which in turn can be caused by
overcharging. As you point out, we don't know how much of the
electrolyte loss was caused by the charger - but the only
possibility that can be linked to what you have posted thus far
is overcharging. Perhaps there are other factors you haven't
mentioned?

But won't an unsealed (i.e., NOT "maintenance-free") battery lose water by evaporation even if it's not overcharged? Otherwise why the need to check the electrolyte level regularly?

If the charger was disconnected and the battery open-circuited for 3 hours, there shouldn't be any *active* bubbling going on. There may be some bubbles still 'stuck' to the plates, but no new bubbles should be forming. If there is after 3 hours of open circuit, that would be a sign of internal current flow (an internal short). And that would be bad.

SG on lead acid batteries have a couple of different ranges depending on the exact battery details. I've seen 1.250, 1.265 and 1.280 for fully charged. 1.117 seems very low.

The fact that all cells read the same is a good sign. Usually, one cell will fail before the others and so it's SG will be decidedly lower.

Such a low SG makes me wonder if maybe the electrolyte was lost from spillage or something and *not* just discharge and electrolysis. Evaporation and electrolysis just leaves a stronger acid solution chemicals behind and adding distilled water dilutes it back to the proper concentration. Actual spilling of acid from a cell needs to be replaced with new acid of the proper concentration though.

When I first got my technician ticket, my assigned call sign was KI4FAT. After about 6 months, I retired from the Army and applied for and received a vanity call sign of WO2RET. I'm proud of my status both as a military retiree and an amatuer radio operator. When someone asks me what the call sign stands for, I just tell them it means exactly what it says. I also have an amatuer radio operator vanity plate on my car.

As for G4FGQ, the highest compliment I ever had paid to me was after I had been DXing on the 2meter band using a home made Jbeam, I heard an old timer telling the indivual I had been talking to that he didn't catch the call sign but 'that ham with the home made antenna had really done his homework and put it together right because the signal was outstanding.' To have an old-timer call a relative newcomer a "HAM" is probably one of the greatest compliments a person can receive.

Just my 2 cents worth.

Not meaning to get this tread off on a tangent, but the above comment prompts me to point out that even "maintenance free" batteries AREN'T, necessarily. On many occassions I have found it necessary to peel back the paper cover on automotive maintenance free batteries, remove the exposed cell caps, and add water, especially after a year or two operating in a hot climate. I don't believe marine type batteries would be any different in this regard.

Just to complicate matters, I eventually found the Web site for these
batteries (the only marking on it is "Stowaway Tournament"; I had bought
it at Sam's and assumed it was a "store brand," but it's made by -- and
acknowledged by -- Exide). Somewhere in the FAQ they say that they are
"maintenance free" but also "maintenance accessible." How's that for
confusion?

Hi
I just picked up a (stoner) Dymek DA9 active antenna. The tuning cap has somehow been bypassed and it does nothing to affect the station. I was told that this was bypassed intentionally so as to be a broadband antenna. I'd like to resore ti to original and use the tuning cap as a preselector.

Does anyone have a print / schematic on this unit ?

Thanks!

> check the electrolyte level regularly?

Because the battery may get overcharged in service. But
I've had a number of cars over the years that had "regular"
batteries (non maintenance free). The batteries rarely
needed water - maybe once or twice a year - and were
never even close to a pint down. I have 2 non-maintenance
free batteries that were picked up at the side of the road.
I've had them for almost a year, and the electrolyte
level has not dropped. These batteries are not on a charger,
they just sit there. I have another that is on a float
charger for 100% of the time, and has been for almost
2 years. The electrolyte level has not dropped.

Some of us refer to such batteries as "maintenance resistant".

With regard to three-stage charging:

I use at Size 31 - 100 AH - gel-cell battery as the main power source for my radio equipment. Gel-cells are REALLY sealed and can be operated in any position. They do not have vent caps, hidden or exposed, and as the name implies, has a gelled electrolyte rather than a liquid electrolyte. Truly maintenance-free discounting the need to check the connections for tightness and corrosian from outside sources.

I recently put a new charger designed for gel-cell charging into service. This is a professional type charger, not an automotive charger (with price to match), and it has a specific setting (dip-switch on control board) for gel-cells. It was recommended as the proper companion to the battery by the local industrial battery supplier.

In addition, if the current drawn by the load while the battery is being charged is greater than 2A (which it is here) a jumper has to be added on the control board to change it to a two-stage charger or else the control circuitry will see the load current as charging current and adjust the voltage upwards to compensate.

I have also found that when in "charge" mode, the DC output has a 60 Hz component which needs to be filtered between the battery-charger junction and the load. One more thing that "they" don't tell you in books or teach in courses.

Before I forget, please Don't Forget to "Click" on "View sellers other
Auctions", just below where my EBAY screen name is, I have many more
Neat items!
Please DO NOT BID UNLESS YOU ARE PREPARED TO FOLLOW THRU WITH THE
TRANSACTION OR NEGATIVE FEEDBACK WILL BE GIVEN!!
PLEASE TAKE THE TIME TO SEE ALL PICTURES
This is one item i've never seen before!
It is Marked SAMPSON VM-12-120 POWER MODULATOR.
I suspect that its a form of tube type speech audio
compressor/amplifier?
I tried a search on the WWW but only found the values of the two
missing required tubes, one each 12AU6 & 12AQ5.
If I find a couple of these in my "stash". i'll supply them but I just
found out the values(numbers).
It is sold untested as nothing else is known.
Luckily I found the AC power cable assembly, so that will be supplied.
I guess these were popular with the Early CB crowd, probably still a
great way to add "AUDIO PUNCH" to your audio be it Ham or CB.
It looks like so few were actually manufactured that SAMPSON,
vibro-tooled the S/N & info on the back!
This one Might even be a prototype, dunno?
Shipping/handeling is $9.00 for Priority

Given its 11 pin connector it is probably a way to add AM to the KWM-2
or 32S-1 Collins or similar CW/SSB rigs. Hams work very little AM, most
probably it was for "Chicken Bandits" who misemploy S-Line Collins as
CB basestations. Because there's no way to unhook the BFO from a KWM-2
the rx audio would have probably been pretty raunchy.

I concur with Phil. Gelcells are the true maintenance free battery of choice for a ham shack. I have run my ham shack off 12V gelcell battery banks for at least 25 years. I have always simply floated the battery with a regulated 13.6V 4A power supply. It charges the battery as needed and floats it at 13.6V when the battery becomes charged; no danger of overcharging. If the power goes out, there is no need for switch over . . . shack is still running off the battery. About every 6 or 7 years I replace the battery(s).

More recently I have pulled the AC power supply off in favor of 55watt solar panel with home brew regulator ..... set for 13.6V max. Still works like a dream.

I have a couple MFJ 1270b & 1270c TNCs. They were previously used as a TCP/IP switching node and each contains TheNet firmware. I would like to put one of them back to normal ham ax.25 packet firmware that came with the original unit.

Can anyone advise me where I can find an EEPROM with the original firmware?

PROTOTYPE released at Japan Ham fair 2005. Not on the market yet.
Differant than the FT9000 series.

http://www.onjapan.net/2005/hamfair/img_0030.jpg

Rumored to come out in both 100 and 200 W
version, and is essentially a less expensive spinoff of the FT9000. Price
is expected in the
$3 to $3.5K range and is hope to be available prior to Dayton. The FT2000
is the replacement of the 1000MP series it appears.

I have a Transmitter which is rack mounted in a cabinet and capable of over 150 watts but will dead key transmit at 120 watts (continuous). The transmit is variable from 5 watts to 120 watts. I also have a dual Receiver rack mounted in a cabinet. Both have power supplies and are very heavy duty pieces of equipment. Wouldn't take much to convert to a 440 repeater or use as is for volunteer fire department or small city.
Units must be picked up in Dallas.Comes complete with manuals for both.
Will sell (make offer) or trade for good Ham HF rig, or ????.

Pictures of manual & rig:
http://www.grodgers.com/dfwforsale/transmitter440.jpg
http://www.grodgers.com/dfwforsale/receiver440.jpg

Units are skid mounted and virtually unused. Appereantly this was a backup unit.

You might be referring to the azden PCS-3000 not 300. Dont think where
was a PCS-300 unless its an HT! Also you might have asked him
what he wants for it and included it in your msg for your friend as
most of us are not going to chase down URL's takes too much time.

Please don't respond to the spammer. I have him in my ignore list and
if it wasn't for you, I wouldn't see his posts.

Besides, the numb nut treats Usenet as a 'write only' medium. You don't
think he reads these posts, do you?

Finally, I'm disappointed that eBay won't take action against him. They
say that since his email address isn't the address they have on file for
his account they can't do anything about the postings, even though they
are against eBay's AUP. How stupid is that?

It's not eBay or Paypal that are spamming you, it is 'phisher' spammers looking for information on eBay or Paypal accounts.

You really do live under a rock, don't you?

Pretty much. But if enough people keep complaining,
even EBay will yank him.

Landshark

I am looking for the Black (Nylon,Polythene ???) tubing around 6mm OD
and wall thickness of 1mm for construction of 900 MHz whip antenna.
It needs to be fairly rigid as it is glued to an SMA plug.

If anyone can advise what material is typically used and where I could
purchase
a reel of it (maybe it is even pressure tubing for pnuematics ?), it would
be much
appreciated. Australian source would be preferrable.

Thank in advance

Regards

David

Mal,

I cannot see on the web page where they mention the material used for the
Whip Radome ?
They also don't seem to sell any tubing.

Can you advise me which page they advertise the tubing ?

Thanks

Try a gardening shop. Drip/micro spray irrigation uses pvc tubing that might
fit your requirement.
Don't forget to do a microwave oven test on the material because some black
plastics are carbon filled.

I just got one without a manual and need some help. I've figured out how to store and recall, and kind of scan but don't know how the other functions work. The 2.8 filter doesn't work, but red the LED when 2.8 KHz is selected. Other than locking up once in a while, and that might be me, the radio seems to work. Anyone got a manual/copy they want to sell? How about the page on working the keypad functions?
tnx

Help: Collins 51S-1 No rx on 1 band
Hi
I just received a MINT Collins 51S-1
and I tried all bands on receive and all work great
except the AM broadcast band 77 ABC etc.
All other bands are fine?
Can someone tell me where to look for the problem?
I haven't taken it out of the case yet.
Thanks very much......Rich

We have a '96 Chevy Cavalier. When it was time to install the mobile I couldn't find a convenient feedthrough. I'm both mobility- and eyesight-limited and can no longer do all the complicated automotive wiring that I used to do to earn ham radio spending money in my younger days.

I took it to the best 2-Way Radio installaton place in Portland and paid them a bunch of bucks to do that part of the install. I've never regretted it. They hooked up the under-hood stuff per my directions and I did the in-car radio and antenna hook-up myself.

This year is the 21st Anniversary of Sony creating the amazing
ICF2010/2001D radio which I suspect is owned and used by many members
of this group.

I have been a keen user of this radio and some years back I published
two booklets "Get the Best from your Sony ICF2010/2001D" and "Get Even
more from..."

Over the 21 years that the 2001D/2010 has been around, a huge amount of

information has appeared in print & on the web.

When I wrote "Get the Best from your Sony ICF2010/2001D" I collected
lots of stuff. And over the years I've accumulated more material.

Recently I archived my own files onto CD as a personal archive and I
realised that I had material that was no longer available in print and
which had vanished off the Internet!

Over the years people have asked me if my two booklets were available
electronically, but the answer at the time was always "no". Now however

I included them on this archive CD.

It then dawned on me that maybe other people would be interested in
such a CD. I'm happy to reproduce it for anyone who wants it for their
personal use and enjoyment - this is not a commercial enterprise.

SONY ICF2010/2001D CD ARCHIVE
==========
The CD contains the following
1) Get The Best from Your Sony ICF2010/2001D
2) Get Even more from Your Sony ICF2010/2001D
3) Adverts (a selection promoting the 2010)
4) HotRodding (various items on how to modify/improve)
5) Miscellaneous
6) Photo Gallery;
including photos of different versions from different areas of
the
world
7) Repair
Repair tips
Parts; sources and spec sheets
Repairers
8) Reviews
Solo;
Comparative;

International (non-English)
9) Service Manuals
2 different Editions including high resolution colour images of

circuit boards and circuitry
10) More Sony Stuff (Including User Guide)
11) Bibliography

In total there are over 500MB of files on the Archive CD. Files are in
a variety of formats including .doc, .pdf, .bmp, .jpg, txt and .xls

ORDERING
==========
There are two ways of ordering a copy of this CD

1) By post.
Write to me enclosing payment, and your mailing address and I will send

you the CD by return post.
Write to me at: Landsvale, High Catton, York YO41 1EH, England
Cash payment can be $11US; 10 Euro or £5 Sterling notes well concealed

inside an ordinary letter envelope. If you don't want the risk of
sending cash in the post, I recommend registered post.
Non-cash payments such as cheques, Postal Orders or International Money

Orders must be £5.00 Sterling.

2) Over the Internet
You can pay by PayPal by sending payment to: icf2010ATuk2DOTnet
[replace AT with @ and DOT with .]
The PayPal prices are $11.75US; 10.75 Euro or £5.50 Sterling due to
the charges levied by PayPal.

Prices include post and packing. All orders will be despatched by post
in a protective envelope and overseas orders will go airmail. I only
use high quality CDs, such as TDK, to ensure you have a reliable and
long lasting archive.

A GREAT DEAL
===============
This unique CD contains a valuable archive of material, some of it
rare, all of it interesting.

If you have any further questions please don't hesitate to ask.

best wishes

Steve Whitt
icf2010ATuk2DOTnet [replace AT with @ and DOT with .]

On 08/19/05 12:19 am Ed tossed the following ingredients into the
ever-growing pot of cybersoup:

>>The battery was still warm, and each cell was still bubbling slightly
>>after the thing had been disconnected from the charger for about 3
>>hours. The SG of each cell was pretty much the same at approx. 1.1175,
>>and the voltage across the whole battery was 12.4. When I put it back on
>>charge, the voltage rose to 13.3.
>>
>>What do you think?

> I think the battery is bad. I may be remembering wrong, but I seem to
> recall that SG should be around 1.230 for lead acid cells, I think. Also,
> nominal open circuit voltage on a freshly charged battery ought to be at
> LEAST 12.8 volts.

Oops! I got an extra "1" in there for the SG. It should have been 1.175.

Anyway, I did a random series of charging -- sometimes on the 12A
setting (although the ammeter never read that high), sometimes on the 2A
setting -- and resting cycles, adding water as needed. The SG came up to
1.265 (the bottom of the green on my hydrometer), but the "fully
charged" indicator on the charger did not come on.

I then bought a "Vector" 2/6/10A microprocesor-controlled "smart"
3-stage charger (on clearance for a good price) and hooked that up.
After a few hours, it showed "FUL"[ly charged], then switched to
"FLO"[at]; in the latter mode, it is supposed to monitor the battery
voltage (currently 13.8) and "top it up" as needed.

So perhaps this ill-treated battery is not a goner after all.

Thanks for your help.

This is a 2 to 30MHz receiver. Sensitivity is poor below 2MHz. I can't remember if there was a way to bypass the preselector on this unit. It has been a long time since I have had one.
Basically, there are 1MHz ranges in the preselector assembly with additional tracking provided by the tuning system. The thing you need to be careful about when buying one of these receivers is the preselector assembly wearing out.
At Rockwell-Collins they used to use a 51J receiver in their service center as one of the pieces of test equipment; it held up better than the 51S.
Stil, if your receiver wasn't abused, it will last a long time.

Hello
Has anyone information on feeding a power wire thru a Chev 2002 Malibu ??
How and where on wall ??

Any information would be appreciated

Tnx John

The way we did it when I worked at a Motorola 2-way shop (70's) was to find a spot on the firewall that was clear from the outside (engine compartment) and inside (passenger cabin). Drill a 1" hole using a hole saw. Install a 1" rubber grommet into the hole. Run wires through the hole in the grommet.

On the newer generation of autos, you might have to search a bit to find the best spot. The spot I always went for was on the driver's side, to the left of the brake pedal. Somewhere below the master cylinder.

Not as elegant as the proper method, but the way I have been doing it lately is find the large rubber grommet where the main wiring bundle goes through the firewall. It usually has a LOT of rubber between the wire bundle and the firewall metal. I "Carefully" stick a small sharp probe through the rubber, being cautious not to damage the wire bundle, and then check the other side visually to see how it looks. Then I remove the probe and using a sharp knife blade turn that hole into a small slit.

I can then pass my #14 DC wiring, and sometimes a small coax through this slit.

3955. FT-1000D 4th IF / Notch and Prod Det - Frequencies? Function?

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-25 20:02:56 UTC
From: ka9s@arrl.net
Message-ID: <1125000176.538040.32740@g43g2000cwa.googlegroups.com>
Source record: 13979

I would like to understand the frequency scheme of the 4th mixer, 4th IF / notch filter, and product detector of my FT-1000D. I would also like to know how these stages function. I bought my FT-1000D in 1992 and it is still my main/most modern rig. It's a workhorse and I appreciate that.

I have the Yaesu FT-1000 Technical Supplement document. It's thick, heavy, and full of good information. But it is totally lacking in any sort of functional description of the rig. I had been spoiled with American boat anchor documentation like Drake and Hammarlund. They go to great lengths to describe the function of each circuit in their rigs. Yaesu acts like it's some great secret, or puzzle to figure out.

Here is what I have surmised so far:

The four local oscillator injection sources are centralized on one circuit board they call the "Local Unit". This makes sense as they have to coordinate the frequency shift of some injection oscillators to realize the IF shift and variable width functions. It's the fourth IF, notch filter, and product detector that are not obvious to reverse engineer. I have surmised the following frequencies:

1st LO - 73.63MHz - 103.62 MHZ (hi side injection to correspond with the tuning range of 100 KHz - 30 MHz).

1st IF - 73.62 MHZ (roofing filter).

2nd LO - 65.405 MHz +- 1.5 KHz (low side injection +- shift / width).

2nd IF - 8.215 MHz (first set of filters)

3rd LO - 8.67112 MHZ +- 1.5 KHz (hi side injection +- shift / width).

3rd IF - 455 KHz (second set of filters)

4th LO - 12.635 MHZ ? (High side injection?)

4th IF - 12.18 MHz? (It seems that this IF exists only to add the LC notch filter).

Product detector oscillator - 12.18 MHZ?

It looks like the LC circuit of the notch filter is fixed in frequency. It seems that the "tuning" of the notch is accomplished by IF shifting the 4th IF. There is an oscillator on the IF Unit (Q 2056). It has two crystals (X2002 - 12.280 MHz, and X2003 - 12.283 MHz). I am guessing

one or the other crystal is active based on the rig being in USB or LSB. This
oscillator is "pulled" in frequency by a varicap diode D 2080 and the front panel variable resistor "Notch" VR 8901-1. This oscillator seems to be mixed with the 4th LO though I can't figure any mixer product that makes sense to me.

The choice of 12.18 MHZ for the 4th IF and notch filter seem poor at best. (I had to reverse engineer this frequency value as it is not documented anywhere I could find.) The achievable Q of a LC notch at 12.18 MHz is going to leave the notch fairly wide (and it is - a crappy notch compared to my Drake R-4C - why bother?). Why they didn't use the 455 KHz IF to implement the LC notch and leave the receiver a triple conversion design is a puzzle to me.

It seems that the injection signal for the product detector does not come from the Local Unit. There is an oscillator Q 3002 with the crystal X 3001 - 12.18 MHZ on the AF Unit board.

Am I even close with this explanation of the 4th IF / notch and product detector? Can anyone explain how this is actually working? Is there any way to make the notch filter narrower / deeper?

Expert insights always welcome.

> Can anyone tell me what the difference in performance would be between
> (handhelds): a 5w GMRS vs. a 5w Marine VHF in mountain terrain
> (ignoring legalities.)

Performance? Do you mean range? If so, the answer is: It depends. The GMRS radios operate on UHF (450 Mhz band) and the marine radios operate on VHF (150 Mhz band). The path loss on line of sight communications will be greater on UHF, but improved receiver sensitivity and easier-to-achieve antenna gain can offset that. The specifications on the individual receivers in question are probably more important determinates of range.

Worry more about the legaliities and less about performance and you'll be OK.

I am providing a free guide on how to make your website rank high in the top search engines. Using this guide and the seoelite software mentioned inside, I was able to make my website - www.studiotrafficguide.com rank in the top 3 positions. (You can type "studiotraffic guide" in Yahoo, Google or MSN search to check.)

I don't know how long I am going to offer this guide for free, so download it ASAP by visiting the link below:

http://www.studiotrafficguide.com/seo_madeeasy.pdf

Be sure to read every word of it, and use the methods diligently. You'd be amazed at how well it works (especially seoelite)!

3964. Wanted: Display Board for the Kenwood TS-830S

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-26 01:17:42 UTC
From: "Murray Green, K3BEQ" <mgreen@erols.com>
Message-ID: <430E6DB6.727FDE98@erols.com>
Source record: 13986

The digital frequency readout display board on my ham bud's TS-830S looses two bands, intermittently. He has checked, rechecked, soldered and resolderd all connections. Comes and goes. Kenwood does not have new boards available. Anyone out there that may have a spare one or an 830S that is junked but has a good board please send me an email at mgreen@erols.com. He has tried just about everything to correct the problem to no avail and he is a top notch technician. Sooo, any help appreciated. Thanks.

Aside from better line of sight performance of the GMRS and Marine units, a CB
will work better over hills.

Not necessarily. As part of setting up a CERT organization in our housing development, we tested CB, FRS and GMRS hand-helds. The CB's and GMRS were 5-watt. Our area contains about 1,600 homes, built around a golf course, with many rolling hills. The goal was to be able to reach from one end of the development to another. The FRS were completely useless. So were the CB's. The GMRS units weren't great, but they did provide acceptable communication. MURS wasn't available at that time. That's what I would look at in this application. The problem with CB's is the antenna. A quarter-wave on the CB band is 9-feet! A quarter-wave on GMRS is about 6-inches. Much easier to have an efficient HT antenna on the GMRS band.

I wouldn't even consider using marine radios on land. Do you really want the FCC AND the Coast Guard on your tail? They take use of these radios very seriously.

3973. 15-tube homebrew rcvr for sale

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-27 14:32:50 UTC
From: David J Windisch <davidjw@cinci.rr.com>
Message-ID: <mQ_Pe.48889$2Q3.41447@tornado.ohiordc.rr.com>
Source record: 13996

Hi, all concerned:

This one was on ebay a while ago. Bids didn't get past the reserve, and I made an after-auction offer which was accepted.

There was no information on what is inside.

I've gotten as far as turning it on, listening on 40M, and documenting the tube lineup.

Its general form is:

6AK5-6JH8-6JH8-6BJ6 X3-6AQ5, with l-o's, bfo, detectors, agc-amps, S-meter circuitry. The r-f stage has separate peaking. The 1st-lo is tuned by a smoooooth National PW-type drive The second i-f has provisions for 2 switched 9-pin plug-in-style mechanical filters and a "wide" position. Sri -- the filters are long gone. Power supply is internal, with plug-in solid-state
rectifier and a couple of 0B2's. Line cord has one of those fused plugs which
purist-collectors drool over. I don't have a pic of the bottom side; however, it's nicely
homebrewed.

Date codes on the tubes are '50s and '60s. All but two of the shields are those nice ones with dissipators inside.

There are 5-pin plug-in coils for 80-10M, and extra BUD ceramic forms, in a box.

Physically, it is H9"XW12" with tilt built in to the design, and 18" deep. It weighs around 30 lb.

I have the ebay jpg's, which can be emailed to interested
parties.

My original intent was to find an "HBT-XX" homebrew transmitter to go with it, and the intent has fallen by the wayside. Oh, well . . .

$300 plus about $40 for insured ground shipping to conus.

73, and tks for reading.

BULLSHIT.

A transaction is a transaction. The fact that one has a minus sign in
front doesn't change the speed at which a transaction can be
processed. The only reason refunds take longer to appear than the
original charges is because companies purposely drag their feet. And
the reason they get away with dragging their feet is because sheep
like you put up with it.

Bottom line, this company has a return policy, which the OP coimplied
with. They have their merchandise back, but the OP doesn't have his
money. And that ain't right.

Near mint condition - one of the cleanest, best working portables I've seen in a long time. No noticeable scratches or nicks. You have to look close to see any signs of use.

Includes an AC adapter, instruction manual and the original shoulder strap.

Super-size the pictures for a closer look.

What s/n is this radio?
I'm moderately interested and I plan to be near Philly in October.
(I'm originally from Philadelphia and Lower Merion, but I've lived in
Wyoming since 1978.)

Heathkit, by Daystrom, Model HA-10 "Warrior" Kilowatt Linear Amplifier, which covers the 10, 15, 20, 40, & 80 bands. It is in excellent cosmetic condition with exception of a few scratches in the paint on one side. We purchased it from an estate and it appears to have been used very little and is very clean. It powers up and has correct plate voltage, however there is a bad hum when the plate voltage is turned on.. it comes with the solid state 866 replacements +_ spare 866 tubes it also has spare 811's and an spare oil filled cap that I purchased to repair the hum. I have not worked on it and due to my health I don't intend to.$250.00 pick-up only. It weighs over 100 lbs (bring help) I'm in the Branson, Mo. Area..

Hello, i'd like to buy a Yaesu FL-7000 HF amplifier for my kenwood TS-870 & TS-2000.

I'm looking for a good unit, perfectly working, well kept, with also 10 meters band and, possibly, not too expensive.

No damaged, unnecessarily modified, or malfunctioning units wanted, please.

I'm located in Italy.

To write me directly please remove antispam from my email address.

Thank you,

3999. 12 vdc to 120 vac inverter recommendation

Newsgroup: rec.radio.amateur.equipment
Date: 2005-08-28 21:37:34 UTC
From: Denton <denton@oregontrail.net>
Message-ID: <11h4bkv3tc11l00@corp.supernews.com>
Source record: 13872

Since I already have a station power supply, with a pair of deep cycle 12 vdc batts floating across a 35 amp power supply with a blocking diode in the dc plus lead, I am thinking of getting a 12 vdc to 120 vac inverter on the battery output...to feed two desktop pc's plus two lcd monitors.

For the past couple of years I have used an APC 1500 ups to feed both pc workstation and also am thinking of just getting another ups to feed the second workstation...if an inverter proves to be now the best way to go.

Before I re-invent the wheel, am wondering if anyone has done this before...thanks

4000. Re: 12 vdc to 120 vac inverter recommendation

I would use a separate APC for each computer, and use the APC to charge
the batteries, also, they will switch back to AC once the power is
restored in time, or when you start up your backup generator, plus they
supply better filtering than most dc to ac converters, unless you get
one with a true sine wave output.

Hi!

Looks like a device used to switch an old style amplifier without a t/r
relay in and out of the line.

Hope this helps

Will

Looks to me like an antenna relay to bypass a Linear amp at the throw of a switch. Most modern PAs have this built in, I think. I suppose it would be useful for an old model PA that didn't have built in bypass capability.

Man that PTO is a real beater! Looks more like garbage material than
auction material. Of course sometimes those are one in the same I
guess.

4014. FA - 12v - 4-amp Power Supply - Ends tonight -

Silent Key Auction for Herb Petereit, W0AFY. If you knew Herb, you knew that he was one of the "old timers". One of his first jobs after moving to Omaha, Nebraska, in the 60's was building Galaxy V's at World Radio. He knew his gear inside and out, knew how everything worked, and took a lot of pride in keeping everything running in top shape. For many HAMS in the Omaha area in the 70's and 80's, Herb was the guy to go to when you needed help.

Herb passed away on Veteran's Day, November 11th, 2003, after a severe bout of pneumonia. He was 71 years old.

This auction is for a very nice Icom IC-211 VHF transceiver. This rig covers 144.00 thru 148.000mhz. It has the built in A/C power supply but can also work off DC. Power out is: SSB, 10 watts, CW, 10 watts, FM 1 to 10 watts. Controls include: mic. Gain, RF power, power SW., squelch, AF gain, mode SW., RF gain, VFO, RIT, NB, AGC, rec/transmit, vox, dim switch, tuning, tuning speed button, dial lock, freq. display, rec. indicator, dial lock indicator, trans. ind, discriminator meter, multi-func. meter. The back has jacks for a scope, ext. spkr., dc input, memory sw., acc. jack, key jack.

Being that I am not an amateur radio operator, I really don't have any good way to test this. However, I did plug in an A/C power cord and it powers up with the meters and frequency LED's illuminated. A/C power cord is included.

On 08/16/05 11:24 am Percival P. Cassidy tossed the following
ingredients into the ever-growing pot of cybersoup:

> I have a 115AH deep-cycle battery that I bought as a stand-by battery
> for my amateur radio station. It has been in a "battery box" on
> trickle-charge (using a charger with a "deep-cycle" setting) for most of
> the time since I bought it over a year ago, and it has been called on to
> supply power only a few times.
>
> Recently I noticed that the "fully charged" LED on the charger was not
> on and started investigating further.
>
> Having not encountered any batteries in the last few decades that have
> not been sealed and "maintenance free," I was surprised to find tiny
> print about checking the electrolyte level every 30 days -- but even
> then it took me a few minutes to figure out how to get access to the
> cells to check this.
>
> Anyway, when I removed the cunningly disguised covers, I found that the
> cells looked totally dry, and each took close to a pint of distilled
> water to bring the electrolyte level above the plates.
>
> The battery has now been on charge for about 20 hours at the charger's
> 12A setting, but most of the time the ammeter on the charger has shown
> only about 5A. The cells are all still gassing.
>
> Is this battery likely to come back to life again, or is it toast? Any
> remedial actions to take?

At one point the new three-stage charger did indicate "FUL"[l], then
switch to "FLO"[at] after I had left the battery on charge for many
hours at varying charge rates, but after discharging it again down to
11.2V I couldn't get it to recharge satisfactorily: the charge rate
would stay at 10A and the battery would get very warm.

I then realized that the free replacement warranty was good for 18
months rather than 12 and that I still had a few days to go. I took it
back to Sam's, and they replaced it free without checking anything other
than the date on the receipt. They didn't put it on test in any way and
didn't even check the electrolyte level. So now I have a new battery
with a new replacement warranty good for 18 months and pro-rated after that.

AND now I know that I'm supposed to check the electrolyte level every month.

Thanks, everyone, for your input.

Perce

4018. Am I the only one that thinks backlite LCD screen ham radios are butt ugly?

Newsgroup: rec.radio.amateur.equipment

Am I the only one that thinks backlite LCD screen ham radios are ugly? When I look at the TenTec Orion, TenTec Jupiter, Yaesu FT-857D, and the Kenwood 2000 I immediately think "ugly". As a matter of fact I think "butt ugly". To me those are some truely ugly radios.
On the good looking side are the TenTec Omni VI, the Drake TR-7, The Yaesu FT-980, Yaesu FT-102, Kenwood TS-940, and the Yaesu FT-1000D. An even older good looking radio is the Drake 4 B and C line twins. Nice looking radios. Am I the only one that reacts this way to backlite display LCD screen radios, or do others think the LCD screen radios are ugly?

I don't mind the LCD radios, as long as they are using some kind of LED backlighting. In this day and age, there is no excuse to use incandescent light bulbs for backlighting. What I really don't care for are the "rounded off" style radios such as the FT847. I reminds me of the current batch of automobiles.
I agree about those older radios with their more "squared off" style being more appealing, but I don't care for the flourescent displays. Reminds me of some sort of appliance like a VCR. I prefer either LED or LCD readouts.
Different styles of radios, different preferences.....that's why there are so many.

Pete

Hello everyone,

Does anyone know what is the power level that comes from RF-unit (Q14)
to the PA-module? I am askin because the transverter output in the rig has
too low output for LT2S. This might be one solution.

In message:

http://groups.google.com/group/rec.radio.amateur.equipment/browse_thread/thread/fc84761aa8
45763e/81d13c9437582a2c?lnk=st&q=ic751+transverter&rnum=1&hl=en#81d13c9437582a2c

Gary says that in ic-735 this is just perfect 5 mW. But how about ic-751a
same signal, what is the power level? Any ideas ?

I have been watching wwltv.com and wdsutv.com on the Internet.
I keep hearing about the lack of emergency services to communicate.
Does anyone know if any Amateur Operators are being engaged to assist?

Here is the latest info that I have:

Fred W4JLE DEC SEOC SC

The on-the-ground situation in SE Louisiana and SW Mississippi is as bad as television is reporting. Neither state is permitting disaster relief agencies into the affected areas except on a very limited basis and only then where conditions are stable. Nearly everyone is still staging as close by as possible and waiting.

The Louisiana SM (Mickey Cox K5MC) and SEC (Gary Stratton K5GLS) are in communications with state officials, who have directed them to NOT advertise for volunteers. Some volunteers have been requested, and these are being staged at the state EOC.

The situation for the Mississippi SM and SEC, Malcolm Keown W5XX, in Vicksburg MS is very uncertain. His station is completely on the ground and EchoLink repeaters in the area are off-the-air. Attempts to contact Assistant SMs have been unsuccessful.

An AB2M.net Amateur Radio operator registration web site has been setup and is ready to go public when approval is received. Some Amateur Radio operators are known to be traveling towards the affected areas with emergency services and disaster relief agencies as dedicated communications resources.

Despite everyone's nearly overwhelming desire to help, about all we can do right now is to make preparations for a prompt response when the officials finally give their approval. None of us know when that will occur.

The West Gulf ARES Emergency Net remains active (7.285 MHz days/3.873 MHz nights), and radio amateurs not involved in emergency communication have been asked to keep these frequencies clear when the net is in session. (this is an emergency H&W freq)

A high volume of health-and-welfare requests reportedly is slowing the passage of critical tactical and emergency traffic. The Salvation Army Team Emergency Radio Network (SATERN) on 14.265 MHz has been accepting and handling general health-and-welfare inquiries on the air and via its Web site.
